Yes, these arguments are definitely "biased". When I was struggling with some Linux things on my Atari TT, I got advices and tips as well from Amiga users. In the Debian scene, I didn�t experience prejudices against other platforms or in this case "sub"-platforms until yet.

Regards,

Kerstin

I installed it on my Hades060 which is really a fast TT030. Where are you at now? The way I did it was to just get all the files for X-Window and put them on one of my partitions. Then I asked Debian Linux to install them. Then Linux would tell me what files were missing and I just went and downloaded them from the ftp Debian website. After I had all of them X-Window loaded in just fine.

Im (trying) to use a ET4000 graphics card in a Mega ST. The card came with a Wittich adapter which plugs into the Mega bus and the Mega PSU. The card appears to power up OK, but I cant get any video out. Ive tried NVDI-5 configured for ET4000 cards as a driver, but it just crashes. Any ideas?

Ian.

Yup, done just that. This does get trick tho. You can fit the adaptor tinto a small box the size of a pack of fags (not poofs). All I have done is to wire hsync to but plugs as well as vsync and gnd. Then get a 4 way dpdt switch and seperate RGB that way, connect the last pin on the DPDT between M0 and grnd. When you flick the switch you will sever RGB from one monitor to the next, and gnding M0 will cause the falcon to kick into VGA mode, open cct is TV mode. Tv mode is fine for most RGB monitors. Note tho that unlike the ST the Falcon will NOT change monitor types untill you change resolution. What I do is keep it set to 640x480x256 or 16bit then change to 16 colour flick the switch and bobs your uncle.

Mark

Do any of you have a copy of the Atari ST Masters of the Universe game?

The game is based on the MOTU movie and is not the same as the Atari 2600 game. You would most likely have the game on a disk for the Atari ST computer system.

I would like to buy an original disk or a copy, or I would like to download the original files from the disk.

Jacob

For sale (UK) - Titan Designs colour "Graffiti" genlock unit for Atari STE

Made by Titan Designs, this is probably a rare item as I don't believe many
were made.
Its a small box with 3 knobs and a button for overlay mode (from what I
remember as I dont have the unit infront of me at present). As far as I know
it only works with an Atari STE. If anyone is interested, please contact me
and I can get some more info for you.

Don't know if it is to any help for you but it is possible to extract the ST font (didn't even know it was called Yuppie) from a TOS image with the STonX package and use it with X-Windows.

How hard of a feat would this be. Is there schematics anywhere. I know there is adapters for the rom port but they are out of my price range. Thanks for any help.

IME file transfers from PC to Atari and vice versa using "sneakernet" is very reliable, so perhaps there's something else preventing the game you mention from functioning on the Atari (wrong TOS version etc etc).

>run properly on either STE, I can't change the port settings, so I can't
>just transfer them that way.

Ghostlink also works very well, but you probably need to install HSModem on the STs involved. There are also programs like PaRCP which use slightly modified 25 pin plug/plug cables to transfer to/from Atari/Atari or PC via the printer ports.

Memory upgrades range from filling the unoccupied RAM chip spaces to upgrade to 1MB, to the much easier way of a SIMM adaptor which allows you to upgrade to a maximum of 4MB. These adaptors are practically plug'n'play.

If you want to see some DIY solutions (dexterity with a soldering iron required), then the best place to look is on Vezz' hardware site.

I don't know of any ROM port solutions BTW, or did you mean the sort that I mentioned above, which plug into/over IC sockets on the motherboard?

I've got an old 1040STE, it's currently being used by a relative to write music with but I can request it back at any time. What I'd really like to do is make it faster, put a bit more RAM in, give it an IDE hard drive (I've got lots of old ones floating around) and run Linux on it. Is this all possible? Is the result likely to justify the effort? I've only just got interested in this kind of thing after I stumbled across a webpage dedicated to this lovely machine. If I can resurrect the old thing and make it useful again I'd like to have a go.

Thanks for any info.

Adam Short

I don't think its easy to make it faster, though some have suceeded.
IDE drive is ease see http://gem.win.co.nz/mario/hardware/ide.html for
interface.
If its stoll a 1040STE it should have 4x256K SIMMS in. Swap for 4x1meg to
make 4Megs of memory.

LINUX won't (at least I don't think it will) run on STE as it has no MMU.
See
http://www.esat.kuleuven.ac.be/~pcoene/atari.html for some info on what has
been done.

I think its probably better used for MUSIC. They are quite good at that...
Get a cheap second hand intel box for LINUX....

Cartridge slot? probably not. You can't add transparent RAM that every
program can use via that slot, without soldering some additional
connections.

Hi Folks,

I seem to recall that MEGA ST2's could be upgraded to 4's by adding chips to spare sockets on the board,
but I can't find the clues any where on the net. Can any one give me a pointer or provide a copy.

TIA
Dave.

Hi Halvard, all you need is tos 1.02 or above for the blitter. My megaSTe did the same crashing thing, check the blitter socket, if somebody has been buggering around in there it may have been damaged, that is what did it on mine;-) You will get alsorts of bus errors and address errors if it is crook....

Hi

>I'm able to audit these sounds on my Mac without any problems, but what
>about the Mega ST? I haven't really spent too much time looking around,
>but it seems that just about all software which can play audio samples
>need DMA hardware, and this is of course something the Mega ST doesn't
>have :-(

If you just want to listen to the sound files then I would say the ST is fine, and the Mega is better with 8bit 50Khz sound. However if you want to record the output for professional use neither is good enough. They have poor analog circuitry and only 8bit resolution. St only has a YM chip synth.

>So I'm starting to think if I should try to get hold of a Mega STe instead, which will even make things a bit simpler as it's already got some of the hardware add-ons I want built-in (HD disk drive, extra high-speed serial ports etc.).
>I have a plain STe as well at the moment, which I don't want to recase, keeping it as a backup machine -I could of course get another STe (or ST/STF/STFM) and use the STe for the 19" rack project, but I believe the Mega STe has more to offer.

Mega STe is a great machine, sometimes I wish I had one. Faster CPU than the STE (although not much faster) and fast serial ports and a very useful VME bus socket. Stable, compatible etc etc. You'll need an adaptor to use the IDE interface as the chip is different and has any one tried IDE on a 16Mhz chip?

Hallvard, I believe I told you that early Megas was shipped without
blitters due to hardware problems. I don't know if it's possible to
retrofit a blitter in these machines, even though I've been told so
previously.

> I believe TOS 2.06 is needed to get access to the blitter (?). Anyway I

No, 1.2 supports the blitter, but you can't disable it like you can with
1.4/1.6 and upwards.

> What happens is that when I go to the desktop, "Blitter" is no longer
> greyed out as it was, but when I select it, the menu just freezes and
> nothing happens!

Hmmm... Sounds very much like a hardware-problem to me. Or are you using
NVDI? I've had problems with the blitter and NVDI on STE's I've owned.

> I don't know if this means that the blitter chip is faulty or that
> there's something wrong with the machine.

If it's not a software-problem I'd assume that you've stumbled over the
very same problem that kept Atari from installing the blitter in the first
place...

> The only thing I can think of is that the previous owner of the machine

> had "Lacescan" installed, to get a bigger screen area. I've removed this
> as it was badly connected, and I wanted to tidy up all the loose wires.

What?? My LaceScan-installation was flawless! ;-) Seriously, did you repair the cut tracks properly when removing that incredibly useful piece of hardware?

> Anyway, I've looked through everything and tried to find any cut traces
> which might affect the blitter.
> I found a couple of bad traces, not knowing if it has been intentionally
> cut or was done by accident. Actually I don't even know where to look
> for cut traces.

Read the LaceScan documentation. *Don't* repair all cut tracks, because Atari had to cut one or two themselves due to various fixes to the motherboard. I haven't seen an Atari without these yet...

> Will any installation of such a circuit affect the blitter?

Don't think so. Ronald Anderson has a LaceScan-modified Mega himself, but it's possible that he just don't use the blitter. It's of no value if you're using NVDI anyway.

> Is there anything I've missed out on? I thought I just had to install
> the blitter chip (the right way of course!), switch on the machine and
> select "blitter" from the TOS desktop...

That's basically it, yes. But as I said, Atari didn't install blitters in the early Megas due to hardware problems.

The reason the early Megas did not come with a blitter was simply because the chip was not ready. I got my Mega2 in -87 without blitter. Later the chip was put in for free by the dealer. I have since then had no hardware problems regarding the blitter itself.

There is however a hardware problems with early Mega2's when using the ROM port. There is too little buffering somewhere leading to all sort of memory problems. The same happens if the computer gets too warm. This problem is also mentioned in the Spectre Mac emulator manual including a fix. As Hallvard wants to use dongles(?) this might be worth looking into. I do have this manual and may look it up if needed...

I got these errors while using Twentyfour and Fast Basic (both using dongles)

>No, 1.2 supports the blitter, but you can't disable it like you can with
>1.4/1.6 and upwards.

Yes you can. At least it's possible to turn it off in the desktop menu in TOS 1.2. Mine had the English version (with ditto keybard) because no Swedish version was ready when I bought it.

>That's basically it, yes. But as I said, Atari didn't install blitters in
>the early Megas due to hardware problems.

See above! I have heard of Megas with an extra chip ontop of the processor to fix some errors but mine have none. The blitter installation was very simple (I did watch when the job was done) but included some minor soldering.

Ahh, that was it! I recall it now that you mention it, this fix (which is a blitter-fix IIRC) is also mentioned in the ADSpeed16 manual, along with an explanation on how to remove it. The removal included fixing a broken track on the underside of the PCB.

Also try these hardware hack pages:

http://www.geocities.com/SiliconValley/Bay/8745/pages/hardware.html
http://atarihacks.cjb.net/

You can add more ram or increase the serial IO speed or increase the processor speed.   You can even connect an ethernet adapter if you can find all the hardware:

http://www.asamnet.de/~hilgarte/ether_e.htm
http://home.nexgo.de/thomas.redelberger/prj/atari/ethernea/

> LINUX won't (at least I don't think it will) run on STE as it has no MMU.
> See
> http://www.esat.kuleuven.ac.be/~pcoene/atari.html for some info on what has
> been done.
>

Actually, that is not true. I have booted the ramdisk image on my modified

(4meg) 520ST.
Paul Coene has taken the Atari Linux from uClinux which is designed to run on
machines without MMUs. The problem is, that there is not much functionality.
Correct me if I am wrong, but I think that Paul has just gotten it to boot.
No real distribution
has been created.

l8r,
Chris

>
>I don't know if this means that the blitter chip is faulty or that
>there's something wrong with the machine.

I may be so. Some versions of MegaST had problems, caused by a faulty batch
of blitters, I believe, which were cured by a little piggy-back board on
top of the CPU. The board contained a 74F74 and a couple of other
components. It was connected to some of the pins of the CPU and by a
short wire to a some point on the board.

>I found a couple of bad traces, not knowing if it has been intentionally cut or was done by accident. Actually I don't even know where to look for cut traces.

IF there is a piggy-back board on the CPU a trace has to be cut on the lower side of the board (opposite of component side).

Lacescan requires two traces to be cut- or reconnected if it is to be removed. One is in the extreme front right corner on the board (beneath the floppy drive) and the other is near the shifter. But if these traces are not properly connected I think you would not have a picture on the monitor at all, so this is probably OK.

>Will any installation of such a circuit affect the blitter?

It should not.

>Is there anything I've missed out on? I thought I just had to install the blitter chip (the right way of course!), switch on the machine and select "blitter" from the TOS desktop...

It is supposed to be so.

Btw. at one point I had problems with blitter on my computer. A couple of years back I accidentaly fried the CPU and an other chip and took the machine to a serviceman as I did not have chip extraction tools. After the repair I found that the machine behaved weird when the blitter was on- trashing text on the screen, not re-writing the menu properly, etc. Eventually, I found that the servieman has accidentaly connected together two address lines when he soldered the CPU. Somehow this did not affect operation without the blitter.

Cu.

Yes, there should be places for chips on the board. Without sockets,
unfortunately. You would have to solder each of 16 chips directly to the board.

* Chips should be 411024, 4C1024 or equivalent 1Mbit x 1 dynamic RAMs.
  Speed 150ns or better. I think they are becoming rare (i.e. expensive).

* It would be good if you soldered a 10nF decoupling capacitor beside
  each chip (places for these exist on the board, too).

* There are two or three 33 Ohm resistors to solder (for RAS and CAS lines).

* Before attempting soldering clean all the holes for chip pins on the
  board- they tend to be filled some resin so that solder would not hold.

I think some of the other that replied to your message has already answered this. Apparently two jumpers near the socket must be removed, I don't have a Mega anymore so I don't have any more information.

>> If it's not a software-problem I'd assume that you've stumbled over the
>> very same problem that kept Atari from installing the blitter in the first
>> place...

> Do you know what this specifically is?

There was a timing problem with very early Megas that caused problems with the blitter. Some of these was patched, either by Atari (early Megas shipped with blitter) or by those who retrofitted a blitter. I know for sure that the Mega I sold you wasn't patched, and I have no idea if it needs patching. If it at some point has been patched and the patch later removed (not likely), there should be a wire from pin 12 to pin 23 on the CPU (probably on the underside of the PCB).

>> Read the LaceScan documentation. *Don't* repair all cut tracks, because

>> motherboard. I haven't seen an Atari without these yet...

> Yes, I've taken a brief look at the Lacescan docs, but they aren't
> exactly too informative. For instance, it doesn't give reference to all

I assume that since you actually get an image on your monitor, you have repaired the correct track(s) (only one or two IIRC).

> the chips mentioned, by number, but rather by what the chips are called.
> How on earth am I supposed to know which chip is the GLUE chip and so
> on?

Chips'n Chips and ST Internals tells you everything you need to know. These hypertexts and a multimeter was the only thing I used to determine how to install LaceScan.

>> it's possible that he just don't use the blitter. It's of no value if
>> you're using NVDI anyway.

> Really? So that's what you meant when you told me I was wasting my time
> installing the Blitter chip! I'll have to re-read those old

If you intend to use NVDI you are indeed wasting your time installing that blitter. NVDI doesn't use the blitter at all I think, if it does then the difference is so small you can't detect it.

I'm looking for how ISA bus is implemented on Hades and Milan.
Especially what are base address on these machines, and if there
are any things to know to how access to ISA locations.

Thank in advance
Laurent

You should just ask Medusa who make it. From what I've been
told and heard the ISA bus is all but useless except for gfx
cards (et4k) and some romport cart adapter.

ok, but if a Romport is available, i think i can put our
ISA board which is just somes classic read/write registers,
no IRQ and DMA at all, just read/write somes byes !
In addition this board use ISA prototype locations.

I will try to search any URL or contact directly
Milan and Medusa, but i'm afraid that they havn't a lot
of times to answer me...

That is true. All the IQ settings were fused into one so the ET4000
graphics card could be used.

That's terrible! Surely the Milan sticks to the IEEE ISA standards as it
has a PC north bridge (or is it south, I forget).

Medusa is pretty good at answering mail, perhaps not right away but Fredi does get to them. If you are producing some usable product I would think perhaps he might anser right away. ;-)

Hi,

I dont know the full in's and out's of this board, but it did definately exist.

Maybe there was some soldering involved.

Tim Anderson

Thank, i expect that our small product will be not ridiculous !
thus, it just a small Jaguar developpement Kit...

I just sent mail to him...

Thank

Laurent

Thanks, that sounds easy enough to follow. I bet the chips are getting rare,
but I may know a few sources......

Where do you come from? I have about 3 I think not used. I would want
your old one though for repair.

Go to a surplus electronics store or a thrift store...and find
a *complete* 1040ST. Buy it and exchange the power supplies.
Save what remains for additional spare parts... I have seen
1040ST's for around $30 U.S. or so...

```

South.

It is as compatible as possible - ie. the ISA BUS implementation is just the
same as in any 5V-PIIX-based Pentium board, including ISA DMA, interrupts
etc. - thats why a standard soundblaster card works just fine in a Milan.

If you need Milan documentation, send me an email with questions - I have
only very terse docs at hand, but will answer technical questions.

That's good to hear, I'm sure for the maker of this card.

I'm trying to revive a TT030/8 that's been sitting in disarray and in peices in a closet for some years.

Problem #1. led, speaker, and battery leads removed. Unfortunately, there aren't clear indications on the mobo as to what goes where.

Problem #2 Missing screws. Does anyone know off hand what size case screws are required to secure the mobo?

Problem #3 That damn sheilding. I've got a TT030/8 with a 32mhz processor and TOS 3.00. It's got that gray metal sheilding in side. Part of the reason the computer sat idle for many years was that immediately after dis-assembly, I couldn't see how to get the sheilding back together w/o it leading to shorts n' such. I found out from the guy at ATY computers that could just rip it all out.

But that said, where is a good place for the speaker to go. Hmmm. will probably depend on where the speaker lead ultimately goes to.

Problem #4, Clock battery. Off hand, where is the best source?

BTW, the computer boots up and seems to run apps just fine. It looks like once I get a new SCSI HD in it that it will make a killer addition to my midi rig.

Funny. I don't think I would have gotten the urge to mess with this stuff unless I hadn't started playing around with that STeem emulator on my pc.

Thanks all,

David

Hello,

I just added a Megafile 30 to my system
and it nolonger sees the HybridArts midiplexer.
I am using the AHDI driver with the following
hardware/software: 4mb ste, HA Midiplexer,
HA SMPTE Mate Sync box, HA SMPTE Track Gold,
Barefoot Edit Track Platinum. Everything was
working great until I added this Megafile 30 to
the DMA chain. I installed it per the
instructions included with the midiplexer.
When the Hard drive is powered I get no midiplexer.
Does anyone know the solution to having the
Megafile 30 and Midiplexer work at the same time?

Thank in advance,

Griffin

I can't tell ya how long the signal is active on the cart. port, but I do know that there are technical differences between the cart port of the Atari Falcon and the Atari ST and STE. Not sure about the TT as I don't own one.

I would like to know the Techinal differences between the Falcon's Cart port and the ST/STE's.

AFAIK, the Falcon's cart port ties directly into the CPU?
Not sure if the ST/STE is like this or not, so maybe the fact that the computers have different processors makes the difference. If this isn't the only difference then someone let me know or correct me if I'm wrong.

I've got a few CART port devices in the works and could use all the info I can get on the Falcons, TT, ST/STE and Mega STE cartridge port features and differences along with Pin out info.

I'll look at the pinouts but I'm sure they're identical pinwise. The
difference in processor (030 being 32bit) means it needs differnet ways of
accessing data, maybe the 030 has more than just UDS and LDS? I think I
have the pinouts for the 030 actually....

http://chimo.unimo.it/~vezz/atari/hardware

Couple of docs there, I've already had leds flashing off this port but I
need the A0!

Signals of the falcon rom port are generated in combo chip.
Timing is a bit different.

Pin out of the port is same as on any other rom port.
That�s all. That�s the point that some older rom port cardridges works
fine on st/ste and not on falcon.

Pin out of the port and some other can be found in doitf030 archive.
(most of is german)

Regards, Robert

Now I am not picking sides and I think I speak for nearly everyone (tell me
if I am wrong) but nobody wants to hear about all of these accusations,
finger pointing, insinuating comments (and that goes for ALL parties
involved).

Is it not about time you all grow up and just leave it alone? We don't want
squabbles in the middle of our small group, this is a public group and these
do not appear to be public matters.

Mark.

Thanks for the info,

The speed question is basically because I am going to buy a new bigger SCSI harddisk for my TT, what would be the best type to go for?

I have been looking at the IBM range, Deskstar with 512K or 2MB cache at 7200RPM and the Ultrastar running at 10000RPM with 4MB cache. I have never understood the cable differences and speed thing (Thin, Wide, Ultra, LVD, DTLA, etc) so I don't even know if any of the above will work, but on the speed side will it make much difference if I go for the 10000RPM, 4MB version or is the SCSI chain on the TT just too slow to show any improvements?

Mark.

I have tried using Gemulator Explorer but I can only see the first
partition.
What im basically trying to do is convert my old Atari cubase arrangements
from the hard disk so i can use them in Cubase on the PC. Is there a way to
convert all the files i want straight into the PC?
Thanks in advance for any help.

Good question, as I may be purchasing a SCSI drive. I think speed
will help as it improves access time, but I'm not sure how much. I
know of 16,000 rpm drives, but they cost a lot. IBM should be OK, but
I think some few had problems with the IDE drives by IBM.

Vermiere and Sweet have made this a public matter by regurgitating
unsubstantiated,
third hand gossip as fact.

There is more of their drivel that is not yet public.

I have no option but to sue them and sue them I will.

Watch this space.

You won't notice the difference between a 5400rpm and a 10000rpm drive on
the TT under normal use. The total access time gets better on the 10000rpm
drive, but the TT's SCSI port is too slow to handle the throughput
even from a fast 3600rpm drive, so I would recommend to look for other
features, eg. a low-noise drive with low heat production.

Hi,

I need to get the YUPPIE font, which is known on the Atari-ST platform,
on either Mac or Windows. Does anyone know where to look or how to do
it. I have it only on my Atari box, but have no idea how to use it on
Mac/Windows.

Rgds,

Andreas

<Reads quick FAQ>

OK, so whereabouts in the UK do I get a parity-enabled SCSI host adapter for
the ACSI port on my 1040 STE or my 520STE?
```

```
And what is the largest drive volume I can use with either machine?  (It
says 1GB for the *MegaST*, which I don't have, and doesn't mention STEs at
all.)

Hi Mark,

>but on the speed side will it make much difference if I go for the 10000RPM,
>4MB version or is the SCSI chain on the TT just too slow to show any
>improvements?
No not really, a 7200RPM drive will do just fine. A Seagate Medialist ST39140
(9 Gig), transfers data at 1920kb/sec, average access is 9 msec on a TT, while
the Quantum Atlas III (10000RPM) average access is 8.5 msec. In practice you
wont notice any difference. A 10000RPM drive generates a lot of heat and is
noisier as well. The Seagate connected to a good SCSI card on a PC easily goes
```

up to 6000kb/sec... the Atlas flirts with speeds around 7500kb/sec. The TT is the bottleneck.

>I have never understood the cable differences and speed thing (Thin, Wide,
>Ultra, LVD, DTLA, etc) so I don't even know if any of the above will work,
I've managed to get SCSI, SCSI-2, Ultra SCSI and Wide SCSI drives to run on a TT, drives with DTLA can cause a lot of headaches... but in the end they will run as well :-), provided you use a good and recent harddisk driver...

>what would be the best type to go for?
From a practical viewpoint I would say opt for a Ultra SCSI drive that runs at 7200RPM, SCSI-2 drives aren't produced anymore, and Wide SCSI requires a quite expensive adapter...
You'll notice the difference between a 5400RPM and 7200RPM drive though, not in transfer speed but in access time, it's up to you if you want to pay for the (small) difference. Avoid Quantum drives if you want to boot from these... as a second drive they are OK.

Cheers from Belgium
Dennis

<SNAP>
The above quoted posting provoked the "crook from up north" somehow ,if I give in now, it means anytime *one of us* posts information which "the crook from up north" doesn't like he's in for the same treatment...
This is a public forum, I rather drop dead than to give in.
I don't care about his business, he's free to ask whatever he likes for a keyboard, harddisk, mouse or original Cubase. But I do care when he tries to shut up someone who suggests a source where the same goods can be obtained from for less...

> We don't want squabbles in the middle of our small group, this is a
>public group and these do not appear to be public matters.

No one does, but unfortunately they are... "the crook from up north" turns them into public matters, time and time again he insults people which aren't even aware of it because they aren't following this group and can't react to it (Sean Barbieri in this particular case). Personally I'm fed up, about once a month he manages in CSAST and CSAST-tech to upset people with his drivel, his latest efforts in this group date back from january, I will not be intimidated by a *cowboy dealer*, hence the reaction. I've got him exactly where I wanted now...
The ball is in his camp, either all my accusations are false and malicious and then he can seek legal action against me, or they are true... in case anyone is wandering: no I haven't fallen on my head, I know exactly what I'm doing :-)

I don't like this constant flow of postings either, "the crook from up north" has given me a much better alternative now to stop them... unless it's realy necessary I will not post into this thread or related ones anymore.

Cheers from Belgium
Dennis

The origional post was last year when vermin and sweat talked about
' driving this wannabe dealer back underground '.

Vermin calls me ' the crook from up north '. This is not true. This is
libel.

He calls me a ' cowboy dealer '. This is not true. This is libel.

We have a phrase, ' Give a man enough rope........'

Watch this space.

Barrie.

What a plonker. Who has to explain their actions to a judge?

> BTW the name is Vermeire not Vermiere, we don't want to sue an innocent
> bloke do we ?
>

Should be interesting. In my experience, a truckload of drivel quickly
diminishes
into a few bloated stories once the relevant parties are asked to
substiantiate
their allegations infront of a judge.

Hm - an 10000 rpm Atlas II should do a bit more than 7.5MB/s - that is more
in the region of an Atlas I drive.

However, on the TT this is really irrelevant.

>Vat registered is a cowboy?
```

I was talking about European dealers in general, it's a practice which is not uncommon... for someone living outside Europe a difference in price between 15 to 21% can make a lot of difference....

Non VAT registered firms will only be allowed to trade under this scheme for maximum two years starting from 2005 (new EEC regulations), a good thing if you ask me, it's unfair competition to dealers which have to charge VAT and it will get rid of the cowboys....

BTW: how does one call "a crook from up north" with "cowboy" attitude?
A desperado.... :-)

Cheers from Belgium
Dennis

So you are implying that the UK's 200,000 non Vat registered small businesses are "cowboys". This is rich coming from a tit who lives in Belgium.

Vat registered firms reclaim the Vat element on purchases each quarter, this reduces the cost of holding stock. They also reclaim the Vat on Advertising, telephones, Internet accounts, Car maintenence, Petrol, heating, lighting, rent,etc, etc, etc.
The non Vat registered firm's cannot reclaim Vat on stock meaning that more capital is tied up in stock. Their operating expenses are more expensive by the Vat charged on the above items.
Quite often it is adventageuos for a small business to be Vat registered even though they have not reached the threshold for compulsory registration. What generally puts them off is the extra paperwork involved.

I must say that from your above remarks you really don't have a clue what your on about.

>
> BTW: how does one call "a crook from up north" with "cowboy" attitude?
> A desperado.... :-)

Ye right!

What has that got to do with VAT? Off topic?

Obviously not being VAT-registered doesn't imply being a cowboy in any field of enterprise. That said, I'd suggest someone who only dealt with Atari product who *was* VAT-registered would be something fo a miracle-worker! B)

> Non VAT registered firms will only be allowed to trade under this

> regulations), a good thing if you ask me, it's unfair competition
> to dealers which have to charge VAT and it will get rid of the
> cowboys...

This posting is based on a misleading premise. If a dealer is not VAT-registered then not only do they not charge VAT but they can't claim VAT back AIUI. VAT by definition is tax on the added value, so if a dealer buys product for 10ukp + VAT and he adds, say, 1ukp to the cost he would have to charge 12.75 ukp with no VAT applied. A VAT-registered dealer would charge 11ukp + VAT which is 12.925ukp - just 0.175ukp different (1.37pc), not the 1.925ukp that's implied (17.5pc).

OK, so whereabouts in the UK do I get a parity-enabled SCSI host adapter for
the ACSI port on my 1040 STE or my 520STE?

And what is the largest drive volume I can use with either machine? (It
says 1GB for the *MegaST*, which I don't have, and doesn't mention STEs at
all.)

hi everyone,

i bought a 1040st with Notator/Unitor about 4 months ago for MIDI sequencing/scoring, and i love it! one problem, though- sometimes notator will not save a seq/pat/sng even when it displays a "byte free" window after the save was requested. does the drive just need to be cleaned, or is a "new" one in order? i'm quite frustrated and would appreciate any help.

i also hear of an external hard disk once manufactured for the 1040st-true? if so, where can i get one- i would be in heaven!

Use a PC one.  If you look for the URL to Halvards Atari Launchpad
under the hardware section there is a file describing putting a PC
drive in an ST.  No soldering required.  I can also help you if you
get stuck.

>i also hear of an external hard disk once manufactured for the 1040st-

Internal too.  You can pick them up anywhere.  SCSI adaptor needed for
SCSI and same with IDE, but the IDE is internal.

>motorola rules (former amiga user),

Yep. They sure do.

Where?  I haven't seen any in Cambridge, UK.

> SCSI adaptor needed for
> SCSI

I know, but again where from?  What part numbers/manufacturers &c?

>for
>the ACSI port on my 1040 STE or my 520STE?

Try for a second-hand Link97 from an ad in here, or phone Atari Workshop
and ask them. You could also add a parity adding circuit to any other ACSI
adaptor, IIRC the circuit can be found on Vazz' hardware page.

>And what is the largest drive volume I can use with either machine?  (It
>says 1GB for the *MegaST*, which I don't have, and doesn't mention STEs at

For TOS 1.04 to TOS 3X the max is 512MB, 1GB comes in with TOS4. Drive
letters can go from C-P.

Have you tried accessing ntlworld with your Atari BTW? I'm curious.

Atari Workshop sells the LINK976, as far as I know.

There is no upper limit for the drive's capacity. Only the paritition
size is limited, depending on your operating system. More information
you can find on http://www.seimet.de/faq_english.html

Depends on the drive. Some do have a soldered jumper, actually most
do these days...

> Have you tried accessing ntlworld with your Atari BTW? I'm curious.

No not yet. I do not have a modem or software for that. I am having
considerable problems transferring downloaded files from my PC to my Ataris.
The drive reads, but the .PRG crashes out with an error dialog when run.
The same .PRG runs fine under PaCifiST. The .PRG in question should run on
the Atari too, it is a game called Insectroid which I had years ago and it
ran back then, unfortunately my mate who I lent most of my Atari software to
lost it when his parents' house got repossessed[1]. Also Ghostlink doesn't
run properly on either STE, I can't change the port settings, so I can't
just transfer them that way.

The STEs are: 1040 with TOS 1.62 and blitter
520 with extra RAM, TOS 1.62 and blitter

Atari produced Hard Drives. Several third parties produced SCSI adaptors.
In the US perhaps BEST electonics are the best known vendors. See

http://best-electronics-ca.com/hard-dri.htm

There is also an IDE adaptor. See
http://gem.win.co.nz/mario/hardware/index.html for info.

To use Ghostlink you need HSmodem installed, along with Xcontrol and

```
the serial.cpx.  This optimises the transfer and you can select the
speed.  Standard ST will only do 19200 but it may be OK at 38400 if
you don't move the mouse.

My Control key is also slagged on my MegaSTE KB, tell me how you get on as I
would be interested.

Mark.

Does the TT SCSI chain support Arbitration?

Not sure what factors this relies on but I imagine it is the SCSI chip set,
in mine is some Adaptec chip but I imagine it is the same as other TTs'.

Does the (potential) speed of the SCSI chain purely depend on the SCSI type
(e.g. SCSI II, wide, etc) or can say a SCSI II chain be quicker by doing X,
Y, Z? (basically I am asking can the TT SCSI chain be "clocked", not
including software enhancements)

Mark.

Mark wrote:

> Does the TT SCSI chain support Arbitration?

This depends on your hard disk driver because software support is required for that on TT and Falcon. CBHD and HDDRIVER support initiator identification and bus arbitration.

> Does the (potential) speed of the SCSI chain purely depend on the SCSI type

It depends on the SCSI type (Ultra allows a higher speed than Fast, for example) on the drive, on the SCSI controller in the computer and on the DMA chip.

```

>�10 plus post.
>I will then have some curly keyboard leads and empty shells to sell.....

LOL.... what about the screws ? :-)

>What does Vermiere et al have against dealers?

Nothing at all Barrie, in fact... I just love them :-)
But I know the difference between a good deal and a lousy one... why should someone settle for a keyboard with Spanish keyboard caps when he can get one with an English keyboard layout and which on top of that only will cost him a fraction of the price?
Mark asked info, you posted some and so did I, and I suppose and assume that he is old and wise enough to make up his own mind? 25 Pounds for a keyboard is IMHO the equivalent of "daylight robbery"....

BTW I wasn't aware that you hold the exclusive rights to give "information" in the Atari newsgroups... whenever someone here asks for advice and if I'm aware of a better alternative then the one your suggesting, I'll post it, if you don't like that, well then just sue me :-)

>>As a non-EEC resident you can also deduct VAT (16%).... , this is
>>something that most European dealers conveniently *forget* to mention.
>>
>Only applies if the dealer is VAT registered and charges VAT.
>UK VAT is 17.5%.

I was talking about *real* dealers ofcourse, not the cowboys.

Cheers from Belgium

Dennis

Debatable.

>why should someone settle for a keyboard with Spanish keyboard caps when
he can get one
> with an English keyboard layout and which on top of that only will cost
him
> a fraction of the price?

Fair point, now you have supplied the info, but, do tell, how long have you
known about this source,
or did you do some frantic digging?
Why don't you provide a list of non UK dealers that you will vouch for?
Will your source break a keyboard and sell the parts separately, thus saving
cost both on the repair and postage?

> Mark asked for info, you posted some and so did I, and I suppose and
assume that
> he is old and wise enough to make up his own mind? 25 Pounds for a

Hi Dennis

Wotcha you old slapper, howz the pimping buisness??.

>>Only applies if the dealer is VAT registered and charges VAT.

>I was talking about *real* dealers ofcourse, not the cowboys.

Do you know of many "Cowboy" dealers?, i can only think of 2.

Hi,

I'm trying to track down anyone that supplies the WD1772 disk
controller chip in the UK .... i need a few !

Any help appreciated...

Thanks

Colin Piggot

put the drum controller to send data on midi channel 10, for
example...
>while someone
>else plays keyboard with say a piano sound?????
put the keyboard controller to send data on midi channel 1, for
example...
Set the midi channel on the receiving devices accordingly et voila...
I hope this helps...

I use Sweet 16. Works great for me. It is commercial though. You can
download some real nice Atari MIDI software at:

http://sites.netscape.net/timconrardy/dwnloads.htm

I wish somebody would plug you, matey, preferably into the mains!

> things must be getting desperate down't narth.

Not in the least.

That's oop north, you failed geography as well as common sense at school
then?

Really, is this the best you can do?

No sensible comment on the price, �59 sterling, your favourite dealer is
asking for
a Mega keyboard? Or any ST keyboard?

I've just had a quick look around your favourite site, matey.
Maybe the group should have a look at some of the prices.

I temporarily rest my case.

If you have an atari an one unitor you have already 3 midi ins and 3
midi outs...
 Do you need more?
Do you have the Notator manual?
I think that is the only thing you need...
If you explain better your problem, I can try to help you...

hi everyone

i just got a atari portfolio computer

the screen dosnt seem to work on it so i pulled it apart and the ribbon cable between the lcd and mainboard is broken

im after someone that can replace this or has a portfolio that dosnt work that they wanna sell

its not like a ide cable its the little flat orange ribbon stuff

if i cant get a replacement i guess i will have to make a cable out of ide lead and have it always open

cheers

>>why should  someone settle for a keyboard with Spanish keyboard caps when
>>he can get one with an English keyboard layout and which on top of that
>>only will cost him a fraction of the price?
>
>Fair point, now you have supplied the info, but, do tell, how long have you
>known about this source, or did you do some frantic digging?
Frantic digging? take a look at Dejanews... back in 1997 I reported this bit
of info for the very first time. I've probably posted it ten times over the
last four years...

>>25 Pounds for a keyboard is IMHO the equivalent of "daylight robbery"....
>
>What colour is the sky....you are entitled to your opinion.
>I, and others,  disagree.
You disagree?
Opinions got nothing to do with this, the simple facts are that someone can
buy two keyboards and with the leftover change buy a pint of ale in his local
pub for the amount you ask for only one keyboard, it might well be that the
hurds of Keychange customers don't mind this or simply don't have a clue....

>> I was talking about *real* dealers ofcourse, not the cowboys.
>Just refer directly to my company as a cowboy outfit and see if I sue,
>matey.
....? are you implying your company is a cowboy outfit? :-)

>You and sweet really are a gutless pair, that much is so obvious.
This ofcourse is complete off topic...
You keep repeating yourself, what is obvious to me is that you need to seek
medical assistance, a lobotomy might just do the trick.

Cheers from Belgium
Dennis

>comment...........

I've already posted a possible solution to dealers demanding "rip off"
prices a couple of days ago, remember?

Remember, in the UK an advertised price is an ' offer to treat. '

I will haggle if customers wish, will your source?

You have checked the source still has stock then?
What is the postage from Germany to the UK?

I *know* that Keychange Music isn't the only dealer asking ridiculous
sums

You mean wanting to be paid......

> for spare parts, but since you're the only one who posted and
advertised...

I forgot, you don't like people advertising in your group, do you?

> high trees catch a lot of wind...

Especially when passed by an a*****e like you.

snip...
> hurds of Keychange customers don't mind this or simply don't have a
clue....

That's herds, matey, tho' I doubt calling Atari users members of a herd in
the present
situation will get you many friends.

I think 'tis you who haven't a clue.

> >> I was talking about *real* dealers ofcourse, not the cowboys.
> >Just refer directly to my company as a cowboy outfit and see if I sue,
> >matey.
> ....? are you implying your company is a cowboy outfit?

You and your chums have done nothing but for the last 6 months, phrases like
' wannabe dealer ' and ' drive back underground ' give the lie to your
drivel.

> >You and sweet really are a gutless pair, that much is so obvious.

> This ofcourse is complete off topic...

Just like most of your posts.

> You keep repeating yourself, what is obvious to me is that you need to
seek
> medical assistance, a lobotomy might just do the trick.

Ah, the personal abuse again

'Bye for now.

>No sensible comment on the price, �59 sterling, your favourite dealer is
>asking for a Mega keyboard? Or any ST keyboard?
When are you going to stop this endless nagging?

At least their keyboards have English keycaps, which is something you can't brag about... you might be the cheapest dealer in Britain, but then that's something someone living abroad doesn't care about at all.
Fast delivery, not mentioning an easy and secure way to pay are much more important... oh, and mutual trust ofcourse :-)

>I've just had a quick look around your favourite site, matey.
>Maybe the group should have a look at some of the prices.
On *that* site the product range and prices are quoted and available for the whole world to see, which is more than a certain dealer "oop north" can brag about...

>I temporarily rest my case.
Amen.

Cheers from Belgium
Dennis

Someone living abroad may not care about English keycaps either, they may
just want a
replacement keyboard.

> Fast delivery, not mentioning an easy and secure way to pay are much more
> important... oh, and mutual trust ofcourse :-)

Your favourite dealer does all this without fail?????

> >I've just had a quick look around your favourite site, matey.

Yup, how much is in stock? Quite a few ' please call for prices ' too.

> which is more than a certain dealer "oop north" can brag about...

My site reflects what I have for sale, moreover, I am the one enquirers talk
to.

Au revoir,

So it's crazy to give the customer a choice.......

>All the stuff they sell is brand new and comes in the original sealed
packaging

So are my keyboards except I test everything I sell.

> >You have checked the source still has stock then?

> They have over a hundred in stock...
>
> >What is the postage from Germany to the UK?

Then customers in the UK will buy from the cheapest source they trust, just
let me
point out my price, �25 is a lot nearer your suppliers' price, about �18,
than your favourite
suppliers at �59.

> BTW: Is this the sixty...four.... questions game? since I'm the dumb ass

You said it........

> and you're the clever one, why don't you do some research yourself?

Think you answered that one yourself.
>
> >That's herds, matey,
> Whatever you say... but the Brittanica and Oxford thesaurus tell me
> different and I put more trust in these...

That's up to you matey, but you're wrong.

> >> ....? are you implying your company is a cowboy outfit?
> >
> >You and your chums have done nothing but for the last 6 months, phrases
> >like ' wannabe dealer ' and ' drive back underground ' give the lie to

> company..., PROOF it...

That's PROVE matey,

>and I'll publicly excuse myself. In the event you can't prove it, then
SHUT UP.

That's the whole point of this ' discussion ', you and sweet post rumour and innuendo
about ' certain ' Atari dealers in the UK, knowing full well there are only three left.
The day I can ' proof it ' is the day I sue you but I suppose you will just keep posting
your gutless drivel, well.....this topic is getting too unweildy, I guess there's only you
and me reading it so until you or sweet pop up in another topic.........

> Honk honk...

Car impressions? or a silly goose?

> perhaps I should show some of your scribblings to a shrink?

Wouldn't go near one in your condition, matey.

> I wander ..

that's wonder

>what he'll make of them... no doubt your illness has a name.

Yup, free enterprise, just what do you do for a living, we know what sweet doesn't?

'Till next we ......email.

Hi Dennis

>oh, and mutual trust ofcourse :-)

Trust is very important, ive heard of a 'Honest' dealer not too many miles away who when sent machines with Veloce's fitted would steal the customers machine and send back an inferior-by-comparison replacement.

I know of at least 2 occasions this has happened..

Hello.
Four posts from sweet, more drivel but....
"Steve Sweet" <steve_sweet@madasafish.com> wrote in message
news:986640930-189753AEicMi@madasafish.com...
> Hi Guys
>
> >> On *that* site the product range and prices are quoted and available
> >>for the whole world to see,
>
> >Yup, how much is in stock? Quite a few ' please call for prices ' too.
>
> There's none of that on your site is there, none at all eh!?.

Your point?

Hi Dennis

>oh, and mutual trust ofcourse :-)

Trust is very important, I've heard of a 'Honest' dealer not too many miles away who when sent machines with Veloce's fitted would steal the customers machine and send back an inferior-by-comparison replacement.

I know of at least 2 occasions this has happened.....

Then pray, tell us, or ask the customers involved to tell us who we should avoid, or is it your little secret?

Hi Dennis

>no doubt your illness has a name. :-/

"Barrie"

Wrong matey, ' Barrie ' is a state of mind you and vermiere will never attain, judging by your posts
----

Dennis dude!!

>>> ....? are you implying your company is a cowboy outfit?

>>You and your chums have done nothing but for the last 6 months,
>>phrases like ' wannabe dealer ' and ' drive back underground ' give
>>the lie to your drivel.

>He'l not try to prove it, he'l just call you a liar and accuse
>you/us/me/anyone else of fabricating everything.

Like what?   Oh, that's ' He'll ', failed English lan as well?

>He'l even deny evidence when posted or twist it in an attempt to
>discredit the poster.

It's called ' rebuttal ', there ain't been any supported evidence posted yet, just your unsupported claims. I include barbiere here, too.

That's ' He'll ', failed English lan as well?

No matey, I will simply defend Keychange against scurrilous attacks based on hearsay.
You have no evidence to support your drivel, that much is plain.

This topic is now too long to be of any use, it's obvious that you and vermiere will probably
continue to ' comment ' on any future posts I make so 'till we ' meet ' again,

Goodbye for now.

Barrie at Keychange. www.keychange.co.uk

Well, I do, but I paid for it, supporting the Atari market. But, mine
has stopped working several times, because I spilled something on it,
giving me an excuse to clean it. Take it apart, and remove the Pc board.

Wash it all down, gently, let it dry thoroughly, and before putting it
back together, touch up any solder joints that do not look shiny and
clean. And while you are at it, from what has been posted in this group,
check the electrolytic capacitor near the processor chip, since if that
leaks, it can keep the keyboard in reset mode.

If all that does not improve the situation, ask again. To me, beverage
residue is the most likely cause of failure.

Hi everyone,

I'm looking for a cheap external scsi cd rom drive, something like the apple
cd150 or cd300 would probably do. Its to use on my atari st (via a scsi host
adaptor) but more importantly for my akai s2000 sampler.

By the way, after more than 8 years its still wonderful to see activity on
these atari groups!  I sadly miss my TT but I'm still using the STE and love
it!

Kind regards

Simon Williams

Just in case sweet and vermieres' drivel has clouded the issue, if any one
needs a
PCB for the TT or Mega STE keyboard I will dismantle a few of my stock and
sell the
PCB or the actual keyboard for �10 each plus post.
New curly cables �3 each plus post.

Info for non TT / Mega STE users.
There is a separate PCB in the keyboard case besides the keyboard itself.

Yep... and in case you're wandering, it isn't AW....

>>On *that* site the product range and prices are quoted and available for
>>the whole world to see,
>
>Yup, how much is in stock?
How would I know? I haven't got a crystal ball to gaze into, for all I know they might even haven't got any at all, but then how do people know that you got some in stock? it all comes down to trust. If a company claims to have the goods in stock, the customer can only take their word for it.

>> which is more than a certain dealer "oop north" can brag about...
>
>My site reflects what I have for sale
Exactly, that's my point... it consists of one single page, you've got to cram all the relevant info into that page meaning that from a prospective customer his viewpoint it's very limited.
BTW did you know that CAB makes a mess of it? it looks alright in Explorer and Navigator but not very impressive on a Atari.

>Au revoir,
I'm from the Flemish speaking part of Belgium....

Cheers from Belgium (Flanders)
Dennis

>In the event you can't prove it, then SHUT UP.
>
>That's the whole point of this ' discussion ', you and sweet post rumour
>and innuendo about ' certain ' Atari dealers in the UK, knowing full
>well there are only three left.
This dicussion is about the price of a MegaSTE/TT keyboard, all I've done
is to inform the people following this thread that instead of having to
fork out �25 they could obtain one from a different source for �11.50,
you obviously don't like this and started abusing me...

>just let me point out my price, �25 is a lot nearer your suppliers'
>price, about �18, than your favourite suppliers at �59.
Point out what ever you like...
BTW my favourite supplier is not a UK based dealer, in general all Atari
hardware, sofware and parts are overpriced in Britain, the keyboards are

just one example...

>>>That's herds, matey,
>>Whatever you say... but the Brittanica and Oxford thesaurus tell me
>>different and I put more trust in these...
>
>That's up to you matey, but you're wrong.
If I'm wrong then two of the leading British dictionaries are wrong, are
you perhaps reinventing spelling?

>The day I can ' proof it ' is the day I sue you but I suppose you will
>just keep posting your gutless drivel, well.....
You can't prove anything, because there's nothing there to proof. It's all a
figure of your imagination ...
I repeat: show me one single posting or stop accusing me.

>this topic is getting too unweildy, I guess there's only you and me
>reading it so until you or sweet pop up in another topic.........
You turned it into the mess it is now, not me... I've stayed on topic in
every posting, I'm not the one who started the abuse, I'm not the one who
called the other party a liar... remember?

>> I wander ..
>
>that's wonder
Wander, wandering, wandered.... according to the Oxford dictionary, but I
suppose following your logic they are just a bunch of nitwits who know
nothing?

>just what do you do for a living,
Once you've sued me... you'll find out soon enough.

Cheers from Belgium
Dennis

>The day I can ' proof it ' is the day I sue you but I suppose you will just
>keep posting your gutless drivel, well.....

Here's your chance to sue me....

>Well, I'm still here, despite your pathetic attempts to discredit Keychange
>Music.

What about this?

You've managed so far to intimidate people here and in CSAST demanding proof of their statements, let's reverse the whole thing... why don't you come up with some evidence for a change?
You've sold Sean Barbieri his LINK97 without him knowing anything about it. Selling someone's property without his consent is a criminal act, it doesn't matter if you (partly) reimbursed him afterwards, it is thievery in it's purest form. Since you claim to keep *all* records of your dealings it should be fairly easy to produce the written consent of Sean Barbieri....
In the event you can't come up with the proof then I can only conclude that you're a thief and a swindler who even has the nerve to call his victim a liar...

You've stated *several* times in different threads that you reformatted Seans harddisk and made it bootable with ICD Pro.
ICD Harddisk utilities is commercial copyright software, unless Sean had bought the package you've no right to put it on the harddisk, not even use it. So, where's the evidence that he bought it? surely you must have the invoice? If you can produce an invoice, isn't it about time you supply him the original disks, manual and registration card?
In the event you can't come up with the proof then I can only conclude that you're not only a thief and a swindler but also someone undermining this platform by illegally spreading commercial software which is a criminal act as well under British law... in other words you're a pirate.

How's that for undermining your "business" and reputation?

No doubt about it ofcourse that all my accusations are false and you can proof it by producing the evidence. Don't expect a public apology cause you wont get it from me, to clear your reputation, sue me. As long as you don't come forward with evidence which proves me wrong I'll refer to you as "the crook from up north" :-)

Note that any threats or personal abuse from yourself will from now on be kept on file and may be used against you in a British court of law.

Cheers from Belgium
Dennis

snip.

I think that's about enough rope, matey.

I've already asked sweet for his address for the solicitors' letter, kindly
forward yours and let the actions begin.

You do have a passport?

Barrie at Keychange.

I seen one in the store, it has what appears to be a rubber
surface that would contact the drive head, if there is a
coil in there I don't know.

That must be how it works, a coil implanted inside the rubber. That
would require a driver a guess, as TOS would not get on if the disk
seemed to be the 64 odd megabytes. I'm not sure though, it may not
even use a DOS type filing system.

Just the 2.2micro cap causing all the drama:-(, fixed no trouble. The mylar
is RS tho, thats causing the CTRL key not to work. All I can say is thank
god it is the one key that has its own data line.
>

Damn, I was after a cheap holiday to the UK, too. Still a few of my Family
are over there. Funny my cousin arrived in Dublin not long after the F&M
scare..........

Yup, $75 replacement. Apparently they have a 75 to 90% failure rating. I
think I will try the labourious repair first. Get a marker and see how that
goes.

Or alternatively order them from Seidl Software in Germany for �11.50, you
can choose between German, French and English keyboard layout...
Payment by credit card, goods are posted with UPS, postage costs should be
somewhere in the �18 region for a keyboard.
As a non-EEC resident you can also deduct VAT (16%).... , this is something
that most European dealers conveniently *forget* to mention.

Or someone who has both an Atari (I imagine one with a HD floppy drive would be needed) and a floppy/memorystick adaptor to try :)

However, if adaptor price is 99USD and probably a similar one for the stick itself, I don't anymore think that the stick would be a convenient media for file transfer, except in very special cases.

There is probably more to it. I assume there must be a power source inside (a miniature battery) and most probably a micro- / or pico-): / processor which handles everything. Then, I suppose there has to be at least one movable part- the little round plate in the middle, with which the spindle of the floppy drive contacts. Possibly there is some sort of azimuth sensor on that rotating plate so that the adaptor can "sync" to drive rotation, and a switch which turns the device on only when the sliding shield for head access is moved aside.

This is completely a speculation now, but the adaptor may indeed have a coil located on the radius where the floppy track 0 should be, and upon reading, it might present (serially, sort of) to the computer some data which look like a boot sector- defining the adaptor like a floppy with some large cluster/sector size, then weird directory and FAT which tell the computer to read complete file from one (or several) sector(s) on the same track. It might be that data sizes in the boot sector, the FAT and the root directory might, in fact, permit a strange 64MB "floppy" without violating too much the standards.

cu.

At a guess (and I have never seen anything about this in print) I would say that the software is needed to read out the bytes as it's unlikely to have a normal disk-type structure. Perhaps it might be possible to translate the formatting on the stick to that of a disk, but I am not sure that is what the driver does. After all, what would be the point? I *think* the images are stored in a TIFF-like format but have special headers with info about number of rows and columns, colour depth etc.

There's likely to be be some sort of index to access individual images but there is no need for a folder structure etc, I would have thought.

The adapter probably only forms an electro-magnetic interface - some type of coil that induces pulses into the floppy's head. Similar in principle to radio tuners that you could put into a personal stereo cassette player in place of the cassette. Needed players with contacts to supply power. The stick adaptor must also be fed with some sort of power to enable readout from the flash memory in serial order.

if u download a disk image of a disk, so long as you have a 5 1/4" drive, it should be possible to use a (disk-image-file)-to-disk program like Rawrite and put them on a double density 5 1/4" disk

If I recall correctly the package stated it did use batteries.

The only reason I even looked into the adapter was I thought
maybe it would give me faster transfer times.  My camera can
make quicktime movies, and they get rather huge real fast
and even at 115k buad take a bit of time to transfer via
the serial port.  I'd be willing to buy a SCSI based SmartMedia
card reader if I could find one and it worked with just HD driver.

Not sure it works with MagiC either. What I've done is install MOUSE.ON
as an application on Alt-9, so I can at least restore the mouse cursor
from the desktop.

Hi,

I use use a Sony Mavica camera with the 1.4 dos disk and my TT with Geneva/Neodesk format and works with the camera. One of the nice things about the Sony is that you can also format with the camera and is compatable with the Atari (TT)

They have in a small cataloge a number of Memory Sticks and disk adapters. There is no mention of additional software needed.
Blurb from catalouge:
"Sony's Memory Stick media lets you capture more digitial images and and links a world of cameras, Camcorders and peripherals in a new lifestyle. With the MSAC-FD2M floppy disk adapter, The Mavica MVC-FD2M floppy Disk adapter, the MSAC-FD85/FD90/FD95 can enjoy the increased capacity and connectivity of Memory Stick, while retaining all of the advatages of familiar floppy disk."

This on the adapter:

"Load Memory Stick media directly into your Digital Mavia camera and dramitically increase your shooting capacity, fits in a standard 3.5" floppy disk drive. Compatable with millions of Windows95/Windows98 and Macintosh computers and applications."

I did notice that this adaption of the Memory sticks can not be

used on my camera, but it the formatting of the 'Stick' system is
entirely from the camera there may be a possiblilty may be used
within the computer. I have no doubts that these cameras that will
handle this will be much more expensive than than my low end Mavica.

Prices for the sticks are:
8MB Stick = 29.95 US
16MB Stick = 49.95 US
32MB Stick = 79.95
64MB Stick = 139.95

Now if you want to by a camera for a formatter :~)

Given the chance this next week I'll call the Tech support
and inquire if special sw is needed for the computer.

Just some new info

Now my Keyboard works, I have got round to fixing the Megaste that came with it;-). It would appear that the tool who had it originally has stuffed the blitter socket. Nice crack down the side. Every time the machine tries to use the blitter it bombs. I have spare blitters, but where to get the IC socket?

Mark

>the serial port. I'd be willing to buy a SCSI based SmartMedia
>card reader if I could find one and it worked with just HD driver.

Ah. Here you go. Dave Barkin in "Atari Computing" Issue 12 P.28

He suggests a Minolta PCMCIA SCSI card reader, Smart Media adaptor card,
HDDriver V7.*

Apparently Microtech (is that a misprint for Microtek?) make these readers
and market under their own brand as well.

Dave mentions he tested this combo on a TT and a Hades 68060 machine.

HTH.

The sticks are can be used for any data, for example MP3s, Documents, etc.
When they are used on an MP3 player they simply appear as a removable device
which you can bump files to, when the software is used to transfer MP3s it
creates a little directory and a couple of catalogue files to go with it.

This is all a bit theoretical but (simple) software will most likely be needed, the trouble is that the sticks are 16, 32, 64, etc.... MB and not 720, 1.44, etc, and - how can I put this, this may be better;

The size of the disk is defined in the first track and sector of the disk (simple), theoretically any size.
The Tracks are limited by the physical ability of the drive (i.e. max of 82 tracks or so).
In 82 tracks the number of sectors required for a 64MB stick would be 750 - 800 sectors.
Sectors are governed by the speed of the rotating disk (normally 9 or 18), theoretically this could be just one BIG disk as nothing is turning the data can simply be feed by the coil until it is done with the track, this would

normally be limited because the disk would return to its original position. The Coil is very unlikely to move rendering the above track theory out, i.e. the sectors just increased by a factor of 82, i.e. there is only one track.

I would say the software simply changes few things so that the BIOS can use 10s of thousands of sectors rather than 9 or 18, what I am trying to say is that the normally memory size to store, address, change the number of sectors is probably a byte and it would need to be a long word (remember the IDE drives, LBA, etc).

I'm not familiar with the Mega, but blitters only came in PLCC package (68pin I think) so any good electrical supplier should be able to get one. Does the Mega still use thru hole stuff, not SMD?

Have you tried pulling the contacts out a bit and super gluing the socket? I know it's not the proffesional approach but it would be a lot easier to do if you didn't have the right tools.

Maplin or Farnell stock these for the UK, but not sure about Australia.

Lyndon Amsdon

Can the machine work when you remove the blitter chip? If it can, you probably would not miss the blitter much- NVDI, for example, ignores it and achieves higher speed through software.

If the blitter chip in a MegaSTE is the same as i na MegaST (it probably is) then the blitter sits in a standard "PLCC" socket which is available in practically any electronic-components shop. Removing the old socket in order to solder-in the new one might be a bit tricky, though.

Is it possible, perhaps, to repair the old socket in place? I would use a tiny drop of a GOOD cyanoacrilate glue (I recommend Loctite 406) to mend the crack, taking care not to touch the pins. Then maybe the pins themselves would have to be sorted a little with a needle or similar tool.

Yes, it works OK, it seems there are 2 different Glue chips for the megaste,
on has an intergrated blitter and the other is a seperate chip using a GAL
to decode. I would like to get this baby working properly again.

The socket is NFG so removing it is no prob, it is a pin thru type.

Socket is too far gone, I used the old cable tie trick to retension it. It
is very fussy, so obviously replacement is the only option.

Hi, Hallvard, they aren't cheap. They aren't an Atari chip either, they are
an off the shelf chip MM9092V, they could be a Nat chip?

I always thought that the Blitter was made escpecially for the ST.
The Ajax, AFAIK is a complete copy of the Western Digital part, except
for the fact that it can handle 32Mhz (ED disks).  I also thought the
AJAX is Atari only.

Hi Mark

Take a look at Rudolphe Czuba's homepage, I seem to remember him
letting alot of sockets and chips go. Let see if I remeber the
address: http://www.czuba-tech.com
I hope that was right.

hey, give me a couple of weeks to get the bits I need, then all will be
well. Then I gotta fix 2 MegaSTs. Well I don't, but I will anyway;-)

"a Mega ST 4 without a blitter"   ?

Was yours an "odd one out"?

I thought all Megas had one as standard fit. (My old "pizza box" Mega 4 had one, all the Megas that I can recall seeing at the local Tariland club meetings during the late 1980s and early/mid 1990s had one, and the "budget TT" MegaSTE that Brian/Mario Becroft bought in the mid 1990s had one)

(I'd heard rumours that some of the very first Megas in 1987 had a blitter socket for the fitment of a blitter chip, but I've never seen one, or spoken to a user with such a machine)

Hi Mark

>> Is it possible, perhaps, to repair the old socket in place? I would
>>use a tiny drop of a GOOD cyanoacrilate glue (I recommend Loctite 406)
>>to mend the crack, taking care not to touch the pins.

>Socket is too far gone, I used the old cable tie trick to retension it.
>It is very fussy, so obviously replacement is the only option.

As a /last/ resort, you could put some surface mount solder paste on each pin after thorough cleaning of device and socket, once inserted in the socket blast it with a hot-air gun, so soldering the thing in permanently with 100% connection.

Taking the old socket out could be a bartard job. I'd cut away as much plastic as i could, exposing the pins to tweezer reach and heat the joint and pull it out of the board. Clean up with desolder braid.

Make absolutely sure of the new socket orietation before commiting it to solder, use at least 4000 different visualy referenced diagrams or photographs or you'l be sorry!!!. :-\

Talking about PLCC sockets have reminded me about one more little thing to
look
at before you scrape old socket: PINOUT.

I'm not joking, pinout of PLCC sockets differ, and chances are you have
bought one with different
pin positions.
I did this once and couldn'd find right sockets anywhere after that.It was
almost as If those things in ST are custom made...

Regards,

Branko

IIRC, the blitter socket is standard, the MegaSTE glue isn't tho. The Blitter appears to be standard. The socket is NFG now, to brittle to repair, so of to Jaycar I go for a replacement. Just got retrenched so it may have to wait;-) Gotta fimily to feed, hhhmmmmm

>solder, use at least 4000 different visualy referenced diagrams or
>photographs or you'l be sorry!!!. :-\

Measure twice, solder once as they say!

The socket I ordered from an electronics mail order place (Maplin) turned out to be too small for the blitter I was trying to fit - I had to order one from an Atari dealer if I remember correctly.

Try resoldering the mouse's connector on the keyboard.
I have seen those failures quite often.
Solder joints evenually give up due to mechanical schocks at connector
insertion, especially if the eare not fixed properly.

Regards,

Branko

Hi,

Is there anybody who has a schematic of the TT keyboard? I have one that doesn't work and I want to repair it...

I have installed Mint and Toswin on mt Ste with 4mb RAM and 30mb HD.
Whenever i try to load programmes(any programme) i get the following:

```
pid 2(Thing Desktop):Privilege Violation.etc etc
pid 4 (Storm(programme)):Address error.etc etc.
pid 1(GEM):Address error.etc etc.
exit code:2816
Leaving Mint
```

Any help would be much appreciated.

I can get them locally for about $4aus (10 roubles ATM:-). If that dosen't
work I think Brad Koda sells gold plated ones.

Being a newly apointed expert try, the megast schems
http://www.fortunecity.com/skyscraper/quadra/455/. All Atari keyboards use
the same layout. If it is completely buggered try the 2.2 micro cap. Fixed
mine fine...

one of the first things that i noticed on my falcon were that many of
the role playing games work on my falcon, not all, but way more than the
regular arcade, or action games.
can anyone tell me why?
also ishar 1&3 work, but not 2, when i get to the music on, or off part
of the menu, then bombs appear on my screen:(
has anone else ran into this?
thanks,
lance

I missed the begin of this thread but the subject reminds me that I found a bug in TK5.07+ patched TOS 4.04 that might caused some of the lock ups during boot. I'll provide a fix soon.

>I have a dead MegaSTE keyboard,

Eek!, a rare item nowadys.

>I think the micro is shot.

What makes you think that?. Have you checked the cabling and the joints
on the socket. Are you shure the MegaSTE is OK?.

Where'd you live?.

hi,

since TOS 4 is designed for the '030 falcon which is also the same cpu as
the TT, is it possible to u/grade a TT to tos 4.0?

```

Just get a new OS altogether.  Mint, Geneva or Magic, a lot simpler
than hacking TOS code.

My other MegaSTe's keyboard is fine, I replaced the TTLs and the Micro and
still no joy. The keyboard is definately getting its 5 volts etc. Kiwi,
living in Aussie.

Hi lyndon, I have just been playing swapsies with my other MegaSTE, the
Mouse is independent of the KB matrix it seems. But I found that the Matrix
is fine except for the ctrl key, which should be easy fixed. I wonder if I
got 2 crook micros? Seems the PCB is the prob, maybe a diode, multimeter
here we come.

You didn't say that it was only the mouse that had failed. The usual cause
for that is loosened solder joints where the mouse connector joins the PCB.
Remake them.

In my opnion, not exactly, because TOS 4.x will try to set somes registers that aren't available on TT. for example, TOS 4.0 could initialize DSP which doesn't exist on TT, in the same idea, there are Videl and specific hardware not present on Falcon.

You certainly need to patch this one to get a running TOS...Not an easy work ;-)

Laurent

>I have a dead MegaSTE keyboard,

I have a quantity of new Mega STE keyboards, price in the UK is �25 inc
post.
They have non UK keycaps, mostly Spanish, but display the language of the
host machine.
You can use your own 'caps.

> > Where'd you live?.
> Kiwi, living in Aussie.

For info. Post to OZ for 1 kbrd is �20. Buy a box of 5 for �100 plus �70
post.
Keep one or two for yourself and sell the rest in OZ.
I've seen a few requests from the southern hemisphere for TT and Mega STE
kbrds on this group.

Barrie at Keychange.

No, that's impossible. The hardware is completely different. MagiC or
MiNT are a better choice anyway.

There are for sure circuit digrams for MegaST keyboard (I know because
I have this diagram) so I suppose there should be for MegaSTE/TT too.
```

On the other side I suppose that MegaST and MegaSTE keyboards are
electrically identical.

I found the MegaST schematics (a long time ago) for complete MegaST on
Vezelli's Atari Hardware Hacks page. Probably MegaSTE is there, too.

cu.

I am inclined to think that the moire effect is practically unavoidable
with a colour monitor. Unless the monitor's shadowmaks/grille has EXACTLY
the same pitch as the picture pixel size, and unless the horizontal
linearity of the picture and the shadowmak is ideal, those patterns will
appear. AFAIK, moire on a TV picture has an additional reason to appear:
when showing a very fine black-white pattern, the "luminance" signal
exceeds its frequency range and enters range allocated for "chrominance"
(or however it is called).

On the other hand, a monochrome monitor CRT has no "pixels", just an uniform
phosphorus coating, so it should always give a better ST-monochrome picture.

It's been a long time since I studied the ST keyboard, but I once had
a broken track stopping the 1 key to work, and this messed up my
joystick port.

It works well enough on most monitors. Perhaps not as sharply as on a mono
monitor, but well enough for most of us. That makes me wonder if I could adapt
the monochrome 13" Mac monitor lying around at the salvation army.

>On the other hand, a monochrome monitor CRT has no "pixels", just an uniform

Sadly, I don't think the adapter would work with the mono CRT I used as a test
subject. It didn't seem to like the ST's frequency (in fact, it did a better
job with the 15 KHz signal).

Amen, finally voice of truth  ;0)
```

It seems that modern monitors fight (with more or LESS success) moire by
finely vibrating
the beam semi-randomly in sub-pixel range...
Until 2 months ago, I was craving for some giant 27" monitor that could
display 4096x4096 in say 256 shades for
exactly this reason.
Two months ago a have got second best thing- SONY 24GDM-W900 (24"
trinitron) ;o)

You could also see if the joystick port works (with a joystick, natch). If
that's OK then it's most likely duff solder joints on the mouse connector on
the PCB as I said earlier.

Indeed. I should have phrased my statament as: "unless the shadowmask has exactly the same or very different pitch than the picture pattern". Moire is an optical effect obtained when two patterns of similar pitch are superimposed. The resulting pattern has the pitch which is equal to pitch difference of the original patterns. I suppose it can get very visible when an Atari is displaying its desktop with 1-black-1-white pattern on a colur monitor. Changing to a solid colour desktop background would probably help. Owing to limitations of its original monochrome resolution, Atari applications seem to use fine patterns much more than, say, PC ones.

>It seems that modern monitors fight (with more or LESS success) moire by
>finely vibrating the beam semi-randomly in sub-pixel range...

I didn't know about that, though I have heard that a similar technique (it's called dithering, isn't it?) is used in some electronic control systems.

This may sound funny, but wouldn't then perhaps a not-very-good colour monitor be moire-free too? I mean- a monitor with a slightly "fuzzy" picture, whose real resolution (beam "dot" size) is significantly worse than the declared one.

I have a question remotely related to the original isuue of "ghosting": does anyone know how long a standard VGA video cable can be without visibly deteriorating picture quality and wiothout overloading the driving circuits (a 640x480 resolution would be fine). At the place where I work it would be VERY convenient if we could move a PC quite far away from its monitor and keyboard (say, 5-10 metres).

cu.

I am using with my baby homemade cable. It is made with 75Ohm RG58 coax for
each signal and is 3m long.
You should see this baby ! Compared to commercial weenie cables it looks
like anaconda !
Works perfect too. Just use quality coax cable of right impedance...

Hi Badsector

>since TOS 4 is designed for the '030 falcon which is also the same cpu
>as the TT, is it possible to u/grade a TT to tos 4.0?

The 030 is about the only thing they've got in common, they are entirely
different machines hardware wise, you'l have to do extensive patching to
graft that 4.04 in.

Perhaps you should have suggested that he checks the lead and plug from
the keyboard to the main PCB first - a bad connection there would stop
the mouse working. *Most* mouse problems are due to either the
connection wire failing at the mouse exit or near the plug, or the pins
of the mouse connector coming loose. Has Mark tried resoldering these?

Hang on, the mouse data is put together with the keyboard data to form
one stream o serial data. If this wire breaks everything will
malfunction. The keyboard is working from what I've understood.

On my Milan I have Mint 1.15.5 and N.AES, I am not sure which version, Mint Setter says I have AES 4.10

On those occasions when a program crashes or has to be killed with CTRL-ALT-Help (or is it Undo ?), the mouse pointer freezes-up.

Often it can be moved by repeatedly hitting the Escape key. This allows me to select Change Res from the Ming Tools menu. Changing the res to the current res seems to cause NAES to restart and then restores normal mouse behaviour.

I am puzzled by this problem because NAES seems to be functioning normally apart from the frozen mouse pointer.

It is very frustrating especially if I am online at the time, luckily NAES can often be restarted without affecting STing.

Is there a fix ?

Peter

: Shielded, you say. What a mess. Should I take the shielding ground for the
: colour signals from the matching ground pins?

There may be something else to look at. I took a quick look for an old
service note about ghosting, but have not found it yet. Some ST machines
did not work with some cables, and the remedy was to change the capacitors
on the output lines to lower values, something like 270 to 10.

Shielding adds capacitance, so you might have to change those capacitors.

Correction: found it. C109 thru C113, 470 pf to 22 pf. TAN # 0001,
1 June '86.

Symptons were 1 ghosting on the right or left side of vertical lines and or characters and 2 wavy horizontal lines on the left 1/4 to 1/3 of the screen, running the vertical length of display.

Problem stated as excessive capacitance on the monitor output lines.

Less messy than improving shielding, and might work.

Jim

Only with heavy patching, unless you have access to the source code. I had TOS 4.06 running on my TT with some quirks which I never sorted out during development of the Milan TOS, but I never had the time to make this into a real working version.

Here is what I have tested/replaced so far - The Micro (2 different ones), the TTL chip 74ls244, Lead, Keyboard mylar/matrix, and have resoldered EVERY joint. All the above are a/ok. So now I am buggered. I get how it works, the PCB is only single layer, so hardly challenging. I also socketed the IC's for convenience. Bit of a dilly of a pickle.

Mark

I there any way I can grab files from a memory stick (such as the ones in Digital cameras)?

I imagine I would need a Parallel Stick reader or something but I do not know if there is any software about that will let me do it on the ST (well Falcon or TT).

Mark.

Hi Peter

This is a faint recolection but istr a keyshort that resets the mouse, i
beleive it was ALT (KPD) '.' (alt dot).

Thats all i can recal, youve nowt to lose by trying it!.

Nope, tried 3. I will replace the cap and diode of the reset circuit, I found the schems. It looks very simple now;-)

It would be nice if you got around completing the debugging and
produced a real TOS 3.06 version. I would be very interrested in
such a TOS version with AES 3.20 and 2 MB partition support.

Well, then all I can suggest is testing all the passive components
with a multimeter.

I was interesed in this, too. I suppose that the simplest way may be to find one of those adaptors that permit the memory stick to be read like a floppy disk in a floppy drive. I know such adaptors exist for Sony's Memory stick and for Memory card (or however it is called) by Olympus.

If someone tries this and finds that Atari can handle this in a floppy drive (maybe a HD drive would be needed), please let us know. With a capacity of up to 64MB, Memory stick floppy may make a convenient (though expensive?) medium for transferring large files.

Isn't there a IDE and or SCSI interface for such a thing, that allows it to
be read like a hard drive?

I'm sure this was done with a SCSI adaptor on an Atari.

Yes, you CAN get floppy disk adaptors for Compact Flash cards, but they also
need a software driver - and you can bet which platform that'll be for.

It's possible to get a SCSI reader for those CF cards though (and therefore
possibly those sticks), but they aren't cheap. The article I read said that
one could both read and write to CF from your Atari without further ado.
(Given a hard disk driver).

Hi there,

I need help getting MiNTnet to work. STinG and STiK 2 have been a total failure, and both crash repeatedly on my machine. I have a few GEM clients (aftp, amail, cab 2.8, newsie) with MiNTnet OVL's etc...but now need to get a working MiNTnet to use these AND my internet account which has run several weeks now WITHOUT a succesfull anything other than a ping/traceroute session!!!

I'm running MiNT 1.15.5, with AES 4.1, without minix.

Are there instructions somewhere, that tells me what to put in the mint.cnf and gem.cnf files, where to copy which files, and which files I actually need? Alternatively is there a nice GEM based installer that will do it all for me, including updating any cnf files?

I have all parts needed (net 1.0x, ppp 2.12, mintos 1.41), but just need plain, non-unix flavoured instructions on what to do to get it working, in other words I'm totally unfamiliar with unix, and desperately need GEM!

I'm only using MiNT to get a multitasking GEM/TOS setup, and I am NOT interested in the technical side of things...only in a working internet setup...

Any advice is good advice...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I have an Olympus digital camera and have investigated the floppy
disk adapter that lets you read SmartMedia and it comes with
some sort of software driver, thus rendering it not usable on
the Atari. I wonder how it works though. ;-)

Hi;

I am figuring out cost comparison for some do-it-myself hardware hacking,
so I wondered what might be be, approximately, the price of a MagnumST
RAM & ROM expansion card for a MegaST- if one were available today-
with TOS 2.06 ROMs and some medium amount of RAM. I am interested in
an order-of-magnitude price estimate, not necessarily an exact quote.

Thanx in advance;
cu.

I'm currently using a mini-distribution I've made myself, it requires around 4Mb (it can be slimmed down if you want to) on your C-partition. It's very basic, but contains everything you need to get MiNT-net up and running. It also contains a couple of shells and the most common unix-tools, these are not needed but can be nice to have around if you intend to experiment further with a unix-like setup.

Installing this mini-distribution is quite simple if you're already a MiNT-user, basically you just need to unpack a zip-archive and insert one line in mint.cnf. It doesn't need any ext2- or minix-partitions, but you need either ramfs.xfs or FreeMiNT >= 1.15.10 which has a built in RAM-disk. Also, TosWin 2 and a multitasking AES of some kind (MultiTOS, N.AES, Geneva, XaAES etc.) should be installed.

You'll have to edit a few configuration-files to set up the network though, but it should be possible to use MiCo to do this for you (not tested yet). However, setting up a single ppp-connection is very simple.

Please contact me via e-mail if you're interested in trying this. It would be nice to have it tested by a newbie, as I assume that it needs some tweaking before I release it.

I wonder if it is possible to get the driver code or some kind of specification for reading the sticks.

I have seen USB and Parallel reads/writers but never the disk or SCSI versions.

This would be useful for grabbing and putting images and MP3 as well as normal files, maybe I have found myself a project!!!!

Mark.

Should this really be needed? How does a PC handle this? There is no point
of a memorystick -> floppydisk adaptor if it can not be simply entered
into a standard floppy drive. It should be so on an Atari, too. From there
on it may be, eventually, just a software issue- how to read a floppy of
64MB size.

Btw. the adaptor I have seen looks like a 3.5" floppy disk with a slot into
which a memory stick is pushed.

Sounds to good to be true, doesn't it? I don't know if there is a driver
required or not. Who manufactures the adaptor?

I have here a last year's SONY catalogue. Among the accessories for their
digital still cameras they list, for reading Memory Sticks:

* Parallel-port adaptor (compatible with Win95-98, NT)
* USB-port adaptor      (compatible with Win98, MacOS9.5)
* PCMCIA adaptor        (compatible with Win95-98, MacOS)
* Floppy-disk adaptor   (compatible with Win95-98, NT, MacOS7.6-8.6)

Did you actually try the thing on an Atari with a HD floppy drive?
DOS and Windows insist that any floppy disk inserted should have a
completely standard format, and specal programs/drivers are needed for
reading unusuall disks.  On the other side, Atari has always been noted
for reading almost anything FAT-like thrown into it, and it is not hopeless
even ifthe disk is not a FAT format. E.g. I once used mu computer to salvage
some data from a floppy disk for a Starrag CNC milling machine- it was
formatted to something like 640KB (80x8), some sectors have gone bad
and noone did noot know exactly which data was on the disk- but a simple
FastCopy III was able to retireve all.

What I am saying is: if a computer "sees" the adaptor as some sort of "floppy"
with tracks and sectors and possibly a FAT, it may not be hopeless to try
to read it on an Atari- or write a program that can.

16MB of PS/2-style SIMMs are available as used parts for around 40-50DM. A
MagnumST should be a a lot less than 200DM - if you are not able to track
one down, I can ask Uwe for a price, he should still have some, however, he
will probably only sell inside Germany.

I thought that would work as well. Maybe it is only a TOS feature
it doesn't seem to work under NAES.

Peter

I've also wondered how these work.   The only way I can see it working
is if there is some coil placed near the floppy heads. Does it look
like a floppy when you pull the metal protector back?

I didn't actually try it, as soon as I discovered it came with
"additional software" aka "some sort of driver" I made an assumption
it won't work. The adapater is $99 USD and so I didn't want to
take the chance. The Olympus camera has rs232 output and I've been
using PhotoTip to export the images. It would be nice if the
floppy disk adapter worked and you are correct in that the Atari's
do have a nak for reading most any floppy.

Are there any hardware guru's reading this that might be able
to shed some light on if that is even possible without hacking
TOS?

Michael. Thanks for the reply.   :-)

I must admit, I've never heard of a fiber-glass pen. Would a store like
Radio Shack carry
them?

Not sure of the correct english term - it is used as a special kind of
eraser on ink drawings, and consists of a bundle of thin glass fibres - they
are available around here quite cheap in shops that have stuff for graphics
people and/or technical drawings.

Be careful not to get any glass parts or dust at your skin or eyes.

cu

Thank you for your interest and tips! I�m sorry having "switched the first place", but I don�t know how to switch the second - and I�m not used to!

The problem is, what you said Lyndon, I can�t even save the Jaz to disk and then going to reformat, because the win system doesn�t read/ understand the atari formated jaz! It�s an good idea, but I need a programm/ emulator that makes the win believe reading an atari format.

Maybe you or anyone can give me further advice, please!
Thank you, Mathieu.

On Mon, 26 Feb 2001 06:27:33 GMT, "Richard" <richard.mcgorman.spamfree@home.com> drooled an embarassing wet spot in his lap as he typed:

>I've had a 520ST since 1986. It periodically stop working ever few years
>and I have to re-seat the chips in order to get it working again. Is this a
>common occurrence for others? I've never heard of this problems with
>other computers built in the mid to late 80's.

I never had to re-seat any of the chips on my ST, but I had a
custom-built hard drive way back made from the guts of a Megafile that
I had to re-seat several times due to dust and oxydization. It's
still a common occurrence nonetheless.

Im using an Falcon/Afterburner which has
developed startup problems. Typically when
you switch on the screen clears, flickers a
while but fails to boot. Sometimes it boots

OK. Anyone know what this might be?

Cheers, Ian.

Yes I have a Nemesis board installed. Actually Id like to 'uninstall' it as I suspect that this is causing a lot of instability - and might not actually add much to the performance?

There is also some sort of mod to do if your using a PC power
supply. With my AB mounted in a Falcon Rack, at least
one reset is normal. In a C-Lab case with the stock
power supply, boot-up is consistent.
It's been so long, I have no idea where to look for the
PC power supply trick. Wizztronics would know, if they
still answer emails. Tell them your using a Falcon Rack.
Or maybe Jo or Geir knows. What has Geir been doing anyway?

Mike

The problem with the 520 and 1040 STs is that the motherboard is mounted inside the same case as the keyboard.

The long, narrow PC board tends to flex as you pound on the keyboard, eventually causing the chips to "creep" up out of the sockets.

The very early 520STs exhibited this quite a bit, so eventually Atari put metal clips on the square socketed chips, but the ROM chips still tended to creep because of the flexing.

Systems like the Mega and MegaSTe don't have this problem because the keyboards are separate from the CPU unit.

This creeping chips problem lead to several "popular fixes", predominant among which was the "Atari drop fix", where you'd lift the ST about 12" above the work surface and let it drop. If that didn't fix it, you'd hold it higher and higher, until either the chips made better contact or you smashed the thing and it became moot.

My favorite fix, short of actually disassembling the computer to press the chips down is to hold the computer in both hands, one hand at each end of the case, then "twist" the case almost like wringing out a wet sponge (gently though!).

Actually, after I installed a 4 Meg upgrade, I ended up just leaving
the screws out of the case, and ditching the metal RF shield so I
could just pop the top off and push everything back into its socket at
a moment's notice.

Interesting to note that people would put up with an annoyance like
that because they liked the computer so much..!

I have an Atari 520 ST, single sided floppy (I think) which I upgraded
many years ago to 1Mb of RAM, I have a 40 Mb hard drive and DOS
emulator. I haven't used the Atari in a long time.

My son is now very heavy into music, plays quitar. What is it I need
(hardware and software) for the Atari to take andvantage of it's MIDI
ports? Is it possible to attach the quitars and/or keyboard to the
computer and enter quitar/keyboard music tracks etc, can the
computer play the quitars? Is there a speaker/amplifire system
available for this system? What kind of amplifier speaker system would
it require?

I understand that Cubase and Notator are the sequencers of choice, is
there any freeware, shareware that comes close to this? What is really
needed software wise?

I am now using a PC, what is the best way to download to a disk so the Atari can read the disk, I can't remember anymore?

Is it possible to pick up any of the stuff I need in the Toronto, Ontario Canada region?

thanks in advance..............

Try grounding both the control-lines and see if that helps.

I have removed the Nemesis in my Falcon, and it did indeed improve stability a lot.

Finally sorted. The SIMM on the AB board must have been slightly loose. Boots up fine now. One problem Ive always had is that I cant run the AB utility which lets you set up the cache etc. The machine just freezes up. The driver runs fine though, and luckily its setup OK.

I have inherited a Falcon in a Tower case and a Falcon as it came... and its still boxed too but no system discs... and a batch of STEs and SM124 Monitors.

Will someone please tell me how do you get to use and IDE 3.5" HDs capacity on a Falcon? I have the 85m one which was originally in the Tower Case... its a Quantum and I think its' goosed. I'm going to try it on a connector for a PC I use for repairing laptop HDs and see. In the meantime, I thought it might be good idea to replace the drive in the Tower and install a drive in the boxed Falcon... both 4M as yet. I've brought ST drives up b4 ON STs, using that poor AHDI thing Atari did. I think I've got the latest version now but it doesn't go beyond a 60m HD and the smallest I have to hand is a 340M, the other is a 1.2G.
I really don't want to format a 340 as a 60, or for that matter a 1.2G. I get the feeling from articles I've seen that this is something that can be overcome... perhaps without resort to too much expense or departure from the Atari system.

I'd appreciate pointing to where you get the 14M boards for the Falcon too, if anyone knows.

JLM

And a piece of erasing rubber might be used with similer results. That is,
the rubber used for erasing ink, ofen used in combination with soft
rubber for erasing pencil. The hard part with abrasive particles is most
often colourd blue.

the HD-drive you will need running a sequencer on floppy is no fun.
the atari is fine for simple MIDI-sequencing as the ports are already
there and you dont have the delay-responses you often have on PCs
due to software-routings within the PC software.

> My son is now very heavy into music, plays quitar. What is it I need
> (hardware and software) for the Atari to take andvantage of it's MIDI

only software and MIDI-cables no more hardware - unless you intent
to synchronise old-stylish-tape-machines to MIDI-Clock.

> ports? Is it possible to attach the quitars and/or keyboard to the
> computer and enter quitar/keyboard music tracks etc, can the
> computer play the quitars? Is there a speaker/amplifire system
> available for this system? What kind of amplifier speaker system would
> it require?

there are special MIDI-guitars, you cannot interface a guitar to midi.
all other electronic keyboards, epianos, HD-trackers, effects have midi

understand that midi just memorises the played note not the audio-signal.
for recording you will need additional hardware, or to make it cheaper
a PC with hard-disk-recording facilities !

speakers what for ? home-playing ? stage playing ? have a look at the
huge musik-instrument-stores - here in germany they usuall have good
service as well to help you.

however on basic questions, like "my son wants to make musik" you might
get a sore glance - it's like going into a restaurant saying "i'm hungry".

and understand that proper musik-making is NOT a simple kids hobby.
it can become pretty expensive if you want to make it properly:

i spent about 50.000DM for a homestudio, even with a PC you will have
to spend about 10.000DM for a good start.

> I understand that Cubase and Notator are the sequencers of choice, is
> there any freeware, shareware that comes close to this? What is really
> needed software wise?

i only stick to cubase from steinberg. it uses a dongle that is plugged
into the rom-port. here in germany you might get cubase 3.10 for about
280,-DM - not that expensive if you intent to work seriously.

freeware ? no idea.

> I am now using a PC, what is the best way to download to a disk so the
> Atari can read the disk, I can't remember anymore?

on floppy disk just format a 720kB disk on the PC the ST will read it.
the other way round will be rejected by the PC - thanks DOS !

> Is it possible to pick up any of the stuff I need in the Toronto,
> Ontario Canada region?

this is supposed to be a major city - isnt it ? so it should.
look up the yellow-pages for a instruments shop you should find a few
just have a look there (;

Hi there,
I own a TT with a 32 MHz CPU (68030RC33B) and a 16MHz 68881
FPU(68881FN16B) , but I'm not sure if
the board is a 32MHz one.

You can read the following on the upside of the board :
CA400310 _____REV____ (nothing is written after REV).

On the other side you can read C300720-001 REV A

The 68030 CPU is directly plugged onto the board, there's no daughter
board between the CPU and the board.

Could someone help me ? (I wish I had the TT Field Service Manual).
Regards, Eddy.

PS I can send digital pictures of the mainboard through email if it can
help..

Not 100% sure but I believe that the BUS on a TT runs at 16Mhz but the CPU runs at 32Mhz, it is therefor possible that the FPU runs at bus speed.

Mark.

> Even if it's switched off?

Yes. I've also tried replacing the entire Nemesis with a single 40MHz TTL
oscillator, this was more stable than the Nemesis at 32MHz... It's
possible that mine was defect (e.g. I had to replace the Nemesis' 500KHz
ACIA rx/tx clock with a self made (32MHz TTL and a 4024) to get a stable
keyboard), you might have better luck with your Nemesis.

Just a suggestion, I've used this on a Falcon to PC many times, but
Ghostlink does give control of the PC drive from the Desktop on the Atari.
I've got it for up for dload, since the guy who wrote it did not reply to my
messages.

Go to http://www.concealedcollege.freeserve.co.uk/ and dload it.

I'm trying to get a Falcon to work with HDs > 80M. Need a newer version of
AHDI. If you know of anyone etc. etc.

Regards

John

Hi,

I have an old NEC RGB monitor with TTL/Analog RGB inputs. Is it possible to
build a cable that will run an Atari 1040ST on standard RGB, or will there
be things preventing it, such as the "clock select"?

Thanks in advance!

-Steven

you can do it, very easily...
you can even use a scart tv as an RGB monitor for the st and amiga..

Not with MiNT, as there are decent scc.xdd drivers. Those replace HSModem, and work much better. HSModem should not be used with MiNT, acutally.

Try GEMULATOR 2000. I think that that will talk to real SCSI devices.
You will need to load the driver onto your PC though...

DOIT-Archive
```

DOITF030_ HTML V 7.0.5 Hardware Tip & Tricks Atari Falcon F030

Sie werden in DOITF030 alle Kabel- und Schnittstellenbelegungen neben den Custom Chips und ihrer Beschreibung finden. Auch viele Bau- und Umbauanleitungen zum Atari Falcon F030. Insidertips und komplette Reparaturanleitungen runden das Angebot ganz sicher ab. Highlight dieses Archives sind umfangreiche Reparaturanleitungen f�r fast alle Subsysteme inkl. einer genauen Bauteilebeschreibung. Neben Tips zum Massenspeicheranschluss, der Ramerweiterungen und dem Einbau diverser Beschleuniger, finden Sie hier auch sehr ausf�hrliche Umbauanleitungen der letzten originalen Atari Maschine in andere Geh�use. Video-, SCSI- und IDE-Adapter in genauer Beschreibung sind ebenfalls vorhanden.

DOIT_ST_ HTML V 3.5.1 Hardware Tips & Trick Atari ST Serie

DOIT_ST enth�lt Tips & Tricks rund um die Hardware der ST-, TT- Mega-Serie, des STacy, STBook und der Atari Clones Milan und Hades. Portofolio Anwender finden Tips zu diesen Computer wenn sie etwas einsenden. DOIT_ST ent�lt Pinbelegungen der meisten Customchips, komplette Beschreibungen einzelner Systemteile, Reparaturanleitungen und Bauanleitungen f�r Zusatzhardware. Ethernet-Aschlu�. Das Archiv ist keine Abwandlung einer technischen Dokumentation von Atari.

DOITMAC_ HTML V 2.2. Tips & Tricks zum PowerMac

Sie werden in DOIT_MAC viele Kabel- und Schnittstellenbelegungen neben ihrer genauen Beschreibung finden. Ebenso viele Tips & Tricks sowie kleinere Umbauanleitungen zum Apple PowerMac oder PowerBook. Speichererweiterung, wo mu� was rein, Batterien, Netzwerk, USB, Adapter komplette Beschreibungen der Monitoradapters, Systemsoftware uvm. L�ftertausch und allgemeine Daten und Insidertips runden das Angebot ganz sicher ab. Im Archiv geht es auch �ber Netzwerke, DSL Internet, Airport. DOIT-Mac ist f�r Ein- und Umsteiger, aber auch f�r Fortgeschrittene.

PROFIJAG_ HTML V 2.8 Tips & Tricks zur Atari Jaguar 64 Bit Hardware

PROFIJAG enth�lt alle Kabel- und Schnittstellenbelegungen sowie auch Teilweise die Originalschaltung neben den Custom Chips und ihrer Beschreibung finden. Bau- und Umbauanleitungen zum Atari 64-Bit JAGUAR. Insidertips, komplette Reparaturanleitungen f�r alle Systemteile der Konsole, farbig bebilderte Beschreibungen aller m�glichen Videoanschlu�kabel z�hlen zu den Highlights dieses Archivs. PROJAG enh�lt eine kleine �bersicht �ber einige CD- und Modulspiele.

DOITLYNX_ HTML V 1.7 Die Reparaturanleitung zum Atari LYNX Handheld

DOITLYNX enth�lt neben den Pinbelegungen aller Schnittstellen auch die Pinbelegungen aller Custom Chips, des Modulports und des LCD-Displays. Von allen Baugruppen sollte sich so eine Beschreibung finden lassen. Komplette Reparaturanleitungen f�r das Video-, Sound- und Stromversorgungsteil der Konsole waren bei Herstellung die K�r.

DOITSPEED_ HTML V 1.5 Atari, Mac ISDN und der Hagenuk SpeedDragon

AT-Kommandos, kurze Beschreibungen der wichtigsten Dinge. Inbetriebnahme und wie man es vermeidet lange Sinnlos zu suchen. DOITSPEED ist eine Kurzanleitung zum Speed Dragon, enth�lt Tips zum Betrieb und Anschlu� f�r Atari- und Macintosh Computer.

DOITDRIVE_ HTML V 2.0 Allgemeines zum Festplattenanschu�

Allgemeines zum einfacheren Handling von IDE und SCSI Festplatten. Anschlu� und Betrieb von DVD, CD-ROM, CD-RW Ger�ten. Plattformunabh�nging geschrieben. Enth�lt Jumperbeschreibungen, einfache Richtlinien, alles zur Terminierung, auch 68 pol. und diverse Tips aus Benutzersicht. Pinbelegungen diverser Bussysteme.

Windows runs reliably in this state too.

LOL. The "Atari Drop Fix". I never thought of doing that. Next time for sure. I've opened the case and re-seated the chips on at least five occassions. Maybe if I'd been a little rougher with it, I never would have had a problem. The floppy-head issue that someone mentioned isn't a problem for me since my system has an external floppy-drive. Certainly a concern if you have an internal one.

Thanks for all the responses. Comforting to know that I wasn't the only one re-seating chips. :-)

Richard

Hi,
I think my question wasn't clear, I know that in first TT series
(prototypes and developper versions), the CPU were clocked at 16 MHz,
and they was upgraded to 32 MHz in later releases.
There were also a 16MHZ version with a 32 MHz daughter board (first
commercial releases).

I wanted to know if my TT was one of the very first releases (16MHz) or
a final release (32MHz without daugther board).

This should be easy enough to find out - just run GEM-bench.

The keyboards or the micro?

The answer is "yes" in both cases though, AFAIK.

After dealing with a lot of miswired instructions, I managed to copy a friend's ST->VGA design, a simple five wire layout - GND-GND, MONO DETECT-GND, MONO-RGB, HSYNC-HSYNC, VSYNC-VSYNC. It works, but I'm experiencing a lot of ghosting. I'm using short wires (<1 dm), but they aren't all that thick. Could it be a matter of shielding, or do I need thicker wires?

Wires must be shieled. Thickness shouldn't matter as long as they're
resonable cross section area.

I wasn't too impressed with the image I got from a VGA monitor I just
got. The screen wasn't centered, and there was an anoying coloured
pattern, like the kind you get on TV sometimes on some peoples
shirts/ties. Do you know what I mean?

Not only that, but you should use coax cable with impedance 75 ohms at least for
MONO out line. Otherwise, there could be noticeable reflections in the cable...

> I wasn't too impressed with the image I got from a VGA monitor I just
> got. The screen wasn't centered, and there was an anoying coloured

> shirts/ties.

ST uses pattern of dots to achieve gray background colour in mono mode...
This pattern can interfere with monitor's dot grid in various ways, especially
when
cabling is not right...
Ideally, transistor buffer responsible for monout should be tripled (along with
those 2-3 resistors nearby) so that each one drives it's own colour component.

Simplified solution without rearrangements inside monitor or ST should use 75 ohm
coax only for monout.
At monitor's end, monout signal from coax should go through 39Ohm resistor to
mutually connected RGB
inputs...

Regards,

Branko

Thanks for the tip, I'll use that bit I snipped off a discarded VGA cable,
then. If only those coax cables weren't such a pain to solder.

Resistors? I saw no resistors in the plans I had.

Why the resistor?

Shielded, you say. What a mess. Should I take the shielding ground for the
colour signals from the matching ground pins?

>I wasn't too impressed with the image I got from a VGA monitor I just

A moir� effect, IOW, yes. =)
Should be either due to a bad adapter or due to uncalibrated cannons. I had
much the same effect on a Sony I got cheaply.

Thanks, I'll try this.  The adaptor was made by a company, but I
remeber there was no sign of resisotrs in it, and I've heard other
people also saying these are required.  The aaptor was used on a
Tatung mono monitor so I suppose it didn't need the resistors.

Have yoy tried replacing the TTLs?  And yes, a stuffed keyboard can
muck up the mouse, as it easily mucked up my joystick port once.

Sorry, I'm in kinda financial hurry these days.
But I will try it first (finetuning) it on one of machines that I have got
for service and then report the results.
Thing is, ST IIRC doesnt have precisely 75 Ohm impedance outputs and signal
level is also quite high, so picture
can get too bright (input amps saturation), but those resistors should also
heal that.

Branko dd have some useful posts a few months back about connecting a
VGa up to an ST, to get better quality.  I kept them safe, so if
anyone wants a copy of the post, feel free to email me.  It's better
than him having to retype it all out (was quite a long post)

>it be a matter of shielding, or do I need thicker wires?

Possibly. AFAIK video cable is always shielded. And if you put those three resistors on the MONO->RGB lines the impedances may match better. Also, I have had a similar problem (with SM124 monitor) once when bad contacts developed in the monitor connector due to oxydation. This can be detected because the picture quality changes if you move the connector just a little in its socket.

It should not be difficult to experiment a little.

cu.

Yes, never tried it but theorectically it will work a treat at
640*400.  Look for the pinouts of the atari video port and look for
the pinouts for a standard vga port and match the two up.

I hope you understand it's more than just wiring it in, a hell of a lot more. That's why the PAK was so expensive. Good luck as you'll need it. You need to know all about the ST's TOS and video subsytem along with the various extra pins and timings found on the 030 and put some sort od logic in between.

>First: How can I convert this documents in MS-Word files? I hope they
>gives a way to convert this kind of documents!

Your documents are probably files from First Word or First Word Plus. Do you still have an Atari? Or an Atari emulator for a PC? If so, 1st Word is PD and you can load the files and either print them from there or save them as ASCII which you can load into MS-Word.

There are also PD converters from First Word to RTF, which keep any text styles etc.

If you cannot run an Atari or emulator, try loading the files into a text editor or hex editor that accepts binaries - or at least ASCII values below 32. Then change ASCII 29 and 30 characters to 32 or a space. Any ESC+letter combinations are styles: ESC+u-Umlaut is Bold, ESC+a-Umlaut is italic. ESC+e-circumflex is underlined, ESC+C-cedilla cancels emphasis and returns to normal, and is also used for form-feeds.

>Second: How filesystem are used under atari-st? This is very important
>for me, because when I know this I can try to mount the disk under
>Linux. And I hope this is the first step to analyze the documents.

The filesystem is identical to DOS. The formatting of Atari disks is very similar to DOS but on early TOS versions the first 2 bytes of the boot sector were different. They should be ASCII 235 ($EB = delta) and ASCII 52 ($34 = the number 4) on DOS 3.3 and higher where early Ataris (before TOS 1.04) had two nulls ($00). There could be other code bytes there acting as a branch command for executable boot sectors (e.g. virus protectors, some games).

For the Atari there are some PD programs to write an IBM boot-sector to the disk from an early TOS version that leaves the contents intact. One is DISKMOD.TOS used together with BLOCK0.DAT which contains the actual boot sector to be written to disk. DOn't know if there are similar ones for the PC. If not, and you have an Atari, I could mail it to you. If you don't have an Atari and can't borrow one, send me the disk and I'll either convert it for you and/or convert the DOC to plain ASCII or RTF.

Regards, /Peter/

Hello,

I own a 520 STe and am looking for a SST030 (68030 accelerator made by
Gadgets by Small).

I'd like to know if somebody has successfuly used a SST030 in a STe, and
if there's a way to get one (brand new or used).

Thanks in advance.

Eric Masson

Many ST Hardware "add-ins" don't work in the STE, because it uses a 68K CPU
```

which is physically
different to the ST CPU. So anything that fits over the CPU requires an STE
specific version.

All right, so is there a plcc68 version of the SST030 ?

TIA

�does someone of you know if it is possible to connect the SM124 monitor
�to a VGA port of a PC?

No hope : sm124 where designed for the digital atari monochrome display and so you can't
use it as a regular vga monitor unless you will make BIG modifications inside.

�the thread on the 68060 upgrade for the falcon looked like the 68060
�full chip is the one that is the most desired/powerfull, does anyone
�have a actuall part number for this chip ?

No, but I can order directly from Motorola as my girlfriend work for them. but a minimal
of 20 is a must (officially they don't accept orders for less than 100 pieces).
If have to report you that 2 month delay is common, even for big orderers.

�Gadgets by Small).

Don't know for that card, but you will get a nice gain of speed by only changing the speed of your
ram chip. What kind are they : 41256, 44c256 and wich speed ?

�Looking for 68030 pinout. Got datasheets from Motorolla website, but data
�sheet just has [MISSING] writen in the pinouts section. (A lot of other
�diagrams are missing also).

On some German universities you can search for a software nammed chinchips who features the pinout for
ALL the atari compatible chips. Try on 193.190.204.128 (because it's a good site, but I don't know if
it is there).

�I'm thinking of transplanting an '030 into an ST, for no real reason other than just to see if
�I can make it work.

The 68000 tos is not compatible with that cpu. Lots of years ago I tried to put a 68010 in a ST
because some people told me that it was compatible with the 68000, and it was not.
If you do the hardware work, put a socket for the cpu...
After you did this, you will have to do a lots of software (tos) rewriting to make it work, then
you will notice to have only 20% of speed gain.

I managed to get a nice gain of speed by replacing the 100ns ram chips by 41256

60ns chips, but I
paid them a lot. Maybe some left in my garage...

NB : email reply if you request an answer, as I don't check foreign newsgroup often.

Gilbert

Eric,

I have all the infor on the SST you need.

The SST could be used in and ST computer but, wouldnt fit in a 520 or 1040 case you would have to recase the ST. The Mega on the other hand was a perfect fit for the SST. AS for purchasing a SST board good luck the last one I saw was auctioned off on Ebay and if I remember correctly it sold for over $300. It may have been more but $300 sticks in my head.

Good luck,

Don

Just in case anybody is interested, I managed to contact the
manufacturer and he said the devices rely on an Amiga specific
signal and would definitely not work on an Atari.

Any other idea how to connect an ST to a modern multisync ?

Gerhard

If you can get them (at a good price) then I suggest you talk to Rodolphe
CZUBA (rczuba@free.fr) he is looking for the full versions.

Mark.

I think most people have gone for the EC version as this is much much
cheaper than the full.

If you really want to go for the full chip then you really need to make sure
you get the part numbers right as there is a later 68060 (RC 75 I think)
which is really an LC version, the full with both FPU and MMU was only done
in 50, 60 and 66Mhz versions and NOT the 75MHZ.

Which CPU to use really depends on the application, the later 68060 at 75Mhz
sounds good (if you can find one) as long as you don't use anything that is
FPU intensive.  For Cubase only then the EC is fine and if you really do
still use FPU progs a lot then you need to go for the full.

Mark.

Need to port some adresses. 68000 / 68030 isn�t compatible at all

Checkout DOITST / DOITF030 (both mostly in german language)

(A problem that nobody like to translate some pages an i doasn�t
  like to spent all the time for nothing)

Regards, Robert

How can that be? AFAIK memory access speed in a ST is in fact governed
by the so-called MMU chip- assuming that RAMs are faster than about
150ns. The CPU accesses the RAM "full speed", i.e. at its natural 8MHz,
without any wait states...

I also can't see why people think that going to 0ns parts will make a
differnece, they won't.  Still 3.6Mb/sec or whatever.

Thinking of putting a couple of blue LED's int a couple of ST's, see how it looks.

Does anybody know how reliable the Mega's custom chips are? Are there any
docos avaliable on the net for it?

Mark

What about usin TOS 3.06? I suppose the video subsystem would have to be
rewritten for that too?

Hi..

I doubt it can be done. The PC outputs no less than 3 resolutions in standard VGA - 350, 400 and 480 line modes.. the SM124 can only handle 400 lines. The PC outputs an analogue signal (even in monochrome mode), but the SM124 only accepts a digital input.

You might get "sort of" a picture in 80x25 text mode, put it would be poor quality indeed.

Hello.

In a world awash with VGA and SVGA monitors why on earth would you want to

connect an SM 124 to a PC? No hidden agenda, I'm just curious. Usually
people want to connect an (S)VGA to the Atari.

Barrie at Keychange.

Sorry, but that is nonsense.

Putting faster RAMs in a ST/STE will not gain you any speed. The DRAM timing
is set by the memory controller in the ST chipset, and the DRAM speed does

not matter (provided it is fast enough for that timing, which requires 150ns or faster).

Actually, using very high-speed DRAMs (IIRC faster than 60ns) may cause problems because you violate maximum timing requirements in that case.

cu

Hello out there!

Has anyone of you access or knows where to get a VME Bus LAN Card for an
ATARI TT030 ??? I want to use it also under Linux 68k :)

greets

I have been fortunate to acquire a standard boxed 030 and also a cased 030 along with a batch of STEs and Mono Monitors...second drives etc. Can anyone tell me if the cased 030 was an Atari product or if it was a third party make-up. The cased one uses an external separate keyboard which is kosher as near as I can tell. It carries the appropriate badge but its built into its own casing... a bit like a pc kb. This one seems to have a lot more interfaces around the case too and the case is fitted with the small rubber feet on one edge as if for a knee hole standing position in a desk. Since there was no kb cable with it, I haven't tried to fire it up yet... got to find a din to din lead... not the audio variety, no central pin just five around the bottom circumference. Anyone know any details?

There were some add-on boards for the cartridge port which appear to be for operating/running robot kits built from Lego Technic... a couple of manuals were included. There's no Lego... just the boards, books, and discs. Its marked Personal Robot Ltd. Perhaps someone out there knows a bit about these too?

John

Hallo Michael,

�>Don't know for that card, but you will get a nice gain of speed by only changing
```

the speed of your�
�>ram chip. What kind are they : 41256, 44c256 and wich speed ?
�Sorry, but that is nonsense.
�Putting faster RAMs in a ST/STE will not gain you any speed. The DRAM timing
�is set by the memory controller in the ST chipset, and the DRAM speed does
�not matter (provided it is fast enough for that timing, which requires 150ns
�or faster).

What's you write is perfectly logical, but the result are there : I changed the
41256-100 ns of my
1985 ST (those without power suply nor floppy inside), by 41256-70 and got 15-20 %
of speed gain !

Does the cpu, who access the stack there, doesn't really feel the difference ?

Anyway, I have no explanation for that fac.

>Any other idea how to connect an ST to a modern multisync ?

There are both internal and external scandoublers/flickerfixers for the Amiga.
The external one can't really rely on many specific signals, since the
particular signals of the Amiga video port are mainly clock and genlock signals.
Generating those signals, which as opposed to the multitude of display modes on
the Amiga shouldn't vary much on an ST, should be doable in just a few euros'
worth of components.
There are other external devices which convert any RGB or composite signal to
VGA frequencies, perhaps a TV->VGA converter, if one of those should have a
SCART or other RGB input.

Hi, I have a Turbo030 accelerator, 50Mhz 030, 50Mhz 882, 4 Megs 32bit
very fast dram, TOS 2.06, built in 68000 for compatibility. This is
designed for MegaST's. Works like a charm, and super fast.

I also have a 1040STE, tos 2.06 4 megs. A Matrix M110 hires monichrome
board for MegaST's, and a SuperVGA color card from Wittich Comp for
MegaST's.

Ill let it all go for the first $250+shipping.

Hi,

I changed my music system from C-Lab Atari Falcon MK X to PC! So far so good, but can I use anyway my old atari formated Iomega jaz 1GB discs to make them read in the PC system (win 2000). The audio format is not the problem, but the "system format". Are there any emulator programms? Please help!
Thank you, Mathieu.

How did you measure this? I am quite sure that eg. memspeed will still show the old ~3.6MB/s.

>Does the cpu, who access the stack there, doesn't really feel the difference ?

No, because it is not faster - the CPU waits for the DTACK signal on every acces, and that comes from the GLUE, which generates it so that 150ns DRAMs have had enough time to put the data on the bus.

If you put in faster RAMs, the CPU will still wait that time, even if the data would be available earlier.

cu

Yes, this is normal - it's the quality of the used sockets.

Take out the chips, clean the pins with a fiber-glass pen, and carefully
pull inwards the pins on the PLCC sockets a bit, then re-seat the chips -
this should give you a longer time until the next service is required.

I'm not entirly sure how to do this. You could try an emulator but
the disk handling is left to MS DOS or Windows I think. You can
partition a disk to TOS/DOS compatibility using HDDriver, but then the
files on it will be destroyed. If you have a large internal disk in
the falcon, you could copy the files off the Jaz disks, then use
another Jaz disk that has been partitioned to TOS/DOS format and copy

off the internal drive onto this disk. It will then be read on the PC, but it seems quite a boring process.

Shoot why switch in the first place..? Oh well, the Jaz cart should be able to be read on your PC. I bought some Jaz carts for my Atari Hades clone and they were formatted for the PC. They worked fine on my Atari.

I have seen an MFP do this. It trigger's the Mono detect signal. I had an STFM with a dicky MFP that caused the machine to only work in HI-res. I couldn't see a thing when a colour monitor was attached, just a black screen, and originally assumed the shifter until I got the schematic's and worked it out. Never know could be the same thing.

Multifunction Periphial, I think? It is a very large chip should be labeled
68901. Sit's around the floppy/mouse area.

Multi Function Pherperial (can't spell :)

Name says it all really.  Does interupts, mono detect, system timers,
serial port....  Still made I think.

From "Hardware registers listing" by Dan Hollis:

```
_FPU   | FPU Type
       | Software FPU                                              BIT 3 2 1 0
       | 68040's internal FPU -----------------------------------------' | | |
       | 01 - 6888x present ---------------------------------------------+-+ |
       | 10 - 68881 for sure --------------------------------------------+-+ |
       | 11 - 68882 for sure --------------------------------------------+-' |
       | SFP004 present -----------------------------------------------------'
       | Hardware FPU                                            BIT 11 10 9 8
       | 68040's internal FPU ----------------------------------------'  | | |
       | 01 - 6888x present ---------------------------------------------+-+ |
       | 10 - 68881 for sure --------------------------------------------+-+ |
       | 11 - 68882 for sure --------------------------------------------+-' |
       | SFP004 present -----------------------------------------------------'
```

and TOS 2.06 sets bit 8 for SFP004-compatible (memory-mapped) FPU. If I use a "memory editor" and manualy set both bits 8 and 10, then, for example, De Beer's "SYSINFO" reports that there are two FPUs available. And indeed, as far as I could see, that could be theoretically possible, without conflict. How clever would some application be to interpret this is another matter :)

>Wow! It is a long time (4 years?) ago.
>Reducing the cookiejar size is obviously a stupid bug. :-(

Henk, I apologize very much! I looked into this again, and it was just an unhappy coincidence that made me blame the emulator for reducing the cookie jar. In fact, a stupid .CPX semms to reduce the jar size, and the FPU emulator just happened to be last among the cookie-creating AUTO folder progs in a situation where there were 17 cookies created (one more than original jar size) and the cookie jar status was reported as: used: 17, free: -2, size: 15.

>There is a good reason not to change the _FPU cookie:
>Pure C programs, when compiled with PCFLTLIB.LIB, can use the memory mapped
>FPU directly. In that case the _FPU cookie must report a memory mapped fpu.
>And that is exactly what is supposed to be your machine.

Do you think that they would not understand the coexistence of both FPUs?
I don't have Pure C so I can't test. Can you remember some app that
would use the emulated Line-F FPU so I could try it?

>The emulator is a serious bottleneck. Addressing the memory mapped fpu directly
>is much, much faster.

I am aware of this. However, I suppose that even an emulated (with memory
mapped FPU) Line-F FPU would still be somewhat faster than no-FPU, otherwise
there would be no point in doing this.

>Until you mentioned this licom lib I never stumbled on a Line F using program
>that actually checked the cookie jar. The reasoning is: It is very cumbersome
>to implement both line_F and memory mapped and S/W in a single program.
>Most programs using Line_F cant do anything else.

This is what I found in docs for Licom substitute library for Gfa basic:

>680x0-Unterst�tzung und FPU-Unterst�tzung

I barely understand a little German, but I think this means what I said.

However, with or without manual changing of the _FPU cookie value, I could not convince a program compiled with this library to run any faster, so I could not say if this Licom's feature works at all. Maybe it needs another CPU as well?

>However, if this approach prevents particular programs to use the emulater, there
>is no reason not to provide a version that emulates the cookie as well.

Well, in fact, I could poke into cookie's value with a separate little program I could make for this, but I am not sure of the consequences, or what would be the best value to write (as there are flage for "hardware fpu", "software fpu"- is that the emulated one? etc.).

Cu.

If you can get PageStream to output to an IMG format file (if it uses GDOS
there is an IMG driver available for it) you could use Imagecopy to convert
that to a BMP format file.

The resolution will be quite low for modern standards at 300dpi.

Right, it should be any VGA or SVGA that will work. But, try before
you buy as I have an old Amber VGA from a 386 monitor that doesn't
work with my ST's. I think it was a fixed frequency one.

You're right about a VGA/SVGA not displaying medium/low rez, it can't
go down to the low sync frequencies. For this you'll need a Multisync
that can handle a good range of frequencies. Seems to be some relays
in the back of mine that "clunk" everytime I switch rez, which I

```
actually quite like :)

>Out of interest, is there any kind of executable Falcon program out there?
>Something that shows us long time ST users what the Falcon is actually like?

Demos are kinda designed for this!  Have one of these ready if you
sell, as they can impress buyers.  Really shows the power of graphics
and sound.  Erm...Here it goes..

Whip - Great Virtual light machine with some funky little patterns
Sonolumineszenz - Best demo everybodys says but not mine
Alive - I think this is one of my favourites
Scene music compilation - Quite cool mix of music here

Or just look at the desktop of a CT2 Falcon running 1024*768....

Hi All,

I recently bought a PAL 1040STfm but when I
connect it to my multisystem TV (it's PAL and
NTSC) I see everything on B/W.

The same happen on other two different TV's.

But, I found a TV wich shows me half of the screen
in the real color and half in a distiorsioned
color. For example, in the TOS desktop I see half
in green (the real color) and half in violet. That
TV is the only one wich has a PAL/NTSC switcher
button...

Could it be the modulator? How can I fix that?

Thanks for all!!!!

Hello.

snip.

> OK, but I need the actual specs, which I will include in the
> Notator FAQ.
> It's not enough to say that a standard PC monitor should work, "but try
> before you buy". I need something more concrete than that, numbers,
> specs and that sort of thing.

The following is based on supplying over 500 ST replacement hi res monitors to musicians, mostly for Cubase, occasionally for Notator, between 1994 and today. All first hand experience, not third hand gossip.

Opinions expressed are mine, based on daily use of Notator and Cubase.

Please read it carefully, do not make any presumptions and try to be constructive if posting a reply......

*

It is not possible, nor advisable, to choose a replacement monitor for hi res simply on its' spec.

You have to like and live with what you see.

Keychange Music has tested over 20 different VGA monos and found 5 that were deemed worthy of the ST.
A few more displayed but were not considered, by me, good enough for music.

New mono VGAs are now rare in the UK, used colour 15" SVGAs can be bought for much the same price.

I say 15" because the 14" ones are too much of a goldfish bowl to expand the picture on without distortion, not a good thing where music and musicians' eyesight is concerned.

I have also tested 10+ 15" analogue controlled SVGA colour monitors. Most displayed a picture but either were unstable or would not display more than a postcard size picture, often offset to one side. A couple were acceptable but had a 1" border.

Digital controlled 15" (and 17") SVGAs are a different kettle de poisson. I have tried 4 models in the last year and can report they are far superior to any previously tested. OK, they were brand new, but are well worth the extra cost. Nice flat steady picture, less than 1/2" border and on site warranty for 2-3 yrs. A dream to use.

If you leave the Atari (silly person) you have a usable monitor for the PC or Mac.

No, I will not name the models. (Anyone with a satisfactory, tested model can post it, they get the hassle if it don't work)

The only sensible way to buy a replacement monitor is to buy the converter lead first, either from Keychange or the other suppliers, then follow this procedure.

Tuck your ST and mains lead under your arm, (you don't need the mouse, or keyboard if a mega), march into the shop and try one or more in your price range.

Reject any objections based on possible damage caused by the Atari, at least if using a lead supplied by Keychange.

Should you become the object of ridicule simply pull out your credit card or wad of cash, shove it firmly up the salespersons' nose then demand to see his boss. Works every time for me.

If refused any help simply walk out, there are plenty of suppliers to choose from.

Helps if you choose a quiet time.

Keychange sell the converter lead, up to 2mtr long, price �13 plus post. Sound out for an STF/M add �2.

Barrie at Keychange.... where Atarispares is the email address and embraced by both my arms.

>Know what I mean? :-)

Sorry, I never realised you wanted technical details. The monitor has
to sync to 31.25Khz for high rez and 15khz for low/medium. You want
one that is pin sharp and not like old VGAs that are really useless for
image quality.

But as I've read from what Barry says it seems that not all monitors
work actually. This is why I say, try it before you buy it. I don't
want anyone being pissed around by shops that won't let you take back
goods if they don't work. I know what I'm talking about here!

window sizes on stock ST'S are 32k right? on a falcon they are 128k or bigger?
what limits the window on older machines, tos, or hardware, or both? can window sizes be overcome on a older machine?
thanks,
lance

NEVER EVER assume that a window consumes a set amount of RAM!

A windows on-screen dimensions are limited by what the programmer tells the OS the maximum size is, via the wind_create() call to GEM AES.

The only time you would ever need to work out the RAM required for a window are if you need to copy its contents to an off-screen buffer, which you will need to allocate.

In that case, the size of the window can be calculated:

```
    ((PixelWidthOfWindow x PixelHeightOfWindow) x ColourBits) / 8
```

This will give the number of bytes to allocate via Malloc() - although you may need to increase the PixelWidthOfWindow slightly if it isn't a multiple of 8.

Each of these values can be obtained via GEM AES/VDI calls (wind_get() for the width and height, vq_extnd() for the colour depth)

Retrotaku / Zer0-Byte Bookstore offers the following antique computer and videogame books for purchase.

If you are interested in any of the titles, please send an e-mail to retrotaku@otakuboy.com to inquire about availability, or if you have any questions. Full purchase terms are available on the web site:
http://www.otakuboy.com

Thank you for perusing the list.

[000098] Winston, Patrick H.; Prendergast, Karen A. (Editors). THE AI BUSINESS - COMMERCIAL USES OF ARTIFICIAL INTELLIGENCE. Cambridge, Massachusetts, USA: The MIT Press, 1984. First Edition. 8vo - over 7�" - 9�" tall. Cloth. Very Good / Good. Many books on artificial intelligence are couched in theory, what could be. But THE AI BUSINESS is not focused on what could be, they focus on what can be -- for the most part. This book is about commericial applications of then-current Artificial Intelligence programs. What's especially neat about the book is many people from well knowns companies like Atari and IBM wrote these essays. There are also histories of various programming languages and applications, including XCON, Caduceus, WAVE, and PUMA. Also, Artificial Intelligence and Gaming! ON CONDITION: Book is in good, clean condition. The dust jacket is a bit banged up. The light pencil marks on the interior, front end-papers. Have not found marks inside the book.
$12.75

[000003] Sippl, Charles J. , Roger J.. Computer Dictionary & Handbook. Indianapolis, In, Usa: Howard W. Sams, 1980. 3rd Edition. 8vo - over 7�" - 9�" tall. Hard Cover. Very Good / No Jacket. Large dictionary of computer terms. Contains a vast introduction to computers and various languages of the time. Of large interest to someone who wants definitions of computer terms from the era -- programmers of classic systems, early languages, obsolete CPUs, etc. Contains a few predictions on the future of computers. ON CONDITION: Back cover has very light, vertical scuffle mark along height. Upper right corner of back cover has small marks where adhesive glue affixed original price tag. Upper left corner of back cover is pressed. To the left of the title page is a small punch mark into the binding, which is not visible elsewhere. Otherwise, general shelf-wear. Visit http://otakuboy.com
$11.50

[000005] Scanlon, Leo J.. 6502 SOFTWARE DESIGN. Indianapolis, In, Usa: Howard W. Sams, 1980. First Edition. 8vo - over 7�" - 9�" tall. Soft Cover. Fair / No Jacket. A very good introduction to the 6502 microprocessor, a popular 8-bit chip in the early 1980s, used in _many_ computer systems including a number of Apple systems, the Commodore 64 and the Nintendo Entertainment System. Great information on pinouts, how to address the chip, register controls, and much more. Listed as a 6502.org MUST-READ. ON CONDITION: Shelf-worn and creased on many pages. A number of pages were held together via paper-clips. (Grrr..) Many of the passages are highlighted and there are some pencil notes here and there.
$8.00

[000026] Glossbrenner, Alfred. THE COMPLETE HANDBOOK OF PERSONAL COMPUTER COMMUNICATIONS. New York, New York, USA: St. Martin's Press, 1983. First Trade. 8vo - over 7�" - 9�" tall. Hard Cover. Very Good / Good. Special Edition, printed for industry. This book explains how to get online and get into the wonderful world of BBSs, circa 1983. If you remember the computers from the time -- XT, Commodore 64, Apple // series, CoCo, etc. Goes into remarkable detail on the services of the time, the various communications protocols in-use and upcoming. ON CONDITION: Spine upper and lower edges are bent from shelf placement. Dust jacket creased along edges. Also, a "Compliments of Hayes" sticker is affixed on front, but this may not be a defect, depending on your opinion. First page is stamped with a "from the library of" stamp. Visit http://otakuboy.com
$9.00

[000028] Williamson, Mickey. ARTIFICIAL INTELLIGENCE FOR MICROCOMPUTERS. New York, New York, USA: Brady Communications Company, Inc., 1986. First Edition. 8vo - over 7�" - 9�" tall. Half-Leather. Text Book. Very Good / No Jacket. Ready to turn your business into an AI heaven? Want to walk into the office and hear, "Hello, Commander. Computer reporting". This book will explain the 1986-state of AI and where it's going. The focus, as I said, is how you can use it in your business. ON CONDITION: One dent on upper spine and slight wearing on spine where it connects to front cover. Very clean. Visit http://otakuboy.com
$7.00

[000029] McClellan, Stephen T.. THE COMING COMPUTER INDUSTRY SHAKEOUT. New York, New York, USA: John Wiley & Sons, 1984. First Edition. 8vo - over 7�" - 9�" tall. Hard Cover. Very Good / Fair. A really neat tour of the computer industry in the early 80s. All the old favorites and players are here, from AT&T and IBM and DEC to Commodore, Atari, Tandy, Apple (right on the cusp of the Macintosh birth, no less!!!) . Mr. McClellen is warning you, though. "THE COMPUTER INDUSTRY IS GONNA FREAK!" Turns out, he was partly right. ON CONDITION: The dust jacket has bent and slightly creased along its edges. The front of the jacket is foil-stamped, and some of the foil has flecked off in tiny areas and tarnished on one part of the back jacket. Also, bottom left of back jacket has its coating torn, harming some of the text underneath. Book itself has slight shelf-wear on bottom of spine. Visit http://otakuboy.com
$8.00

[000030] Martin, James. DESIGN AND STRATEGY FOR DISTRIBUTED DATA PROCESSING. Englewood Cliffs, New Jersey, Usa: Prentice Hall, 1981. First Edition (?). 8vo

- over 7�" - 9�" tall. Hard Cover. Text Book. Good / Fair. Is James Martin a MAGICIAN? ! You might think so, especially if you check out the picture of him on the back in Conjure-pose. Here he is in a book (one of many) where he extolls of the virtues (in excrutiating detail) of distributed computing. And, yes, this is way before SETI, way before multi-processing PCs running Windows 2000. So, this guy just might be a magician or at least some kind of prophet. ON CONDITION: Dust jacket is creased and torn around edges. It is intact. Books seems to have been stored at an angle. As such, the whole of the book is twisted a bit on the spine. No pages are torn, but the spine has no doubt weakened. Visit http://otakuboy.com

$8.00

[000031] Schreiber, Linda M.. ADVANCED PROGRAMMING TECHNIQUES FOR YOUR ATARI. Blue Ridge Summit, Pennsylvania, USA: Tab Books, 1983. First Edition. 8vo - over 7�" - 9�" tall. Soft Cover. Very Good / No Jacket. A very nuts-and-bolts Atari programming book geared toward Atari's first foray into the world of home PCs -- the Atari 400 and 800s. Covers graphics (ANTIC, specifically) , animation, voice programs, BASIC, disk drive usage, among other things. Includes some nifty programs. And remember: All this can be typed write into one of those Atari 8-bit emulators about the Net. Has a nifty pic of an Atari 800 on the front cover. ON CONDITION: Edge-wear and shelf-worn. Mainly light creasing along spine edges. Otherwise, very clean. Visit http://otakuboy.com

$15.00

[000032] Allan, Boris. POCKET GUIDE: LOGO. Bath, England, United Kingdom: Pitman Publishing, 1984. First Edition. 32mo - over 4" - 5" tall. Spiral. Very Good / No Jacket. A pocket reference guide for that grand, old, "easy" language LOGO. You remember; the one with the turtles that drew lines across your screen. Old programmers know that LOGO is a powerful language with a deceptively simple syntax. This booklet references the entire language. Get the book, download a development environment like WinLogo, and go to town. ON CONDITION: Portion of the original price tag is on front. A minor bubble on the back panel and some light pencil marks on back panel. Visit http://otakuboy.com

$11.00

[000033] Stine, Megan and H. William. MICRO ADVENTURE NO. 2 JUNGLE QUEST. New York, New York, USA: Scholastic, 1984. First Edition. 12mo - over 6�" - 7�" tall. Mass Market Paperback. Good / No Jacket. Scarce - 1984 -- Computers were "the future" and kids could have it all for them if they'd just learn how to program. This books brings kids through an adventure in which small BASIC programs kids would enter into computers from the era woud help save the world! ON CONDITION: Slight creases down edge of spine and front cover. Another crease near the spine on the front cover. Both creases crawl along the length of the book. Small dent in the upper back cover. Otherwise, general shelf-wear. Visit http://otakuboy.com

$11.00

[000038] Conway, Gerry. ATARI FORCE #11 "By Blackjak Betrayed!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9�" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were

distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, Blackjak betrays the Force ... But WHY? ON CONDITION: Very small creases near edges of stapes. Otherwise, pretty clean. Color is good. Visit http://otakuboy.com
$8.00

[000039] Conway, Gerry. ATARI FORCE #2 - "Dart Vs. the Warbeast". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9�" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has a profile of "Champion". BONUS: Ad for TREASURES OF TARMIN for the Intellivision. ON CONDITION: Some light creases around covers, mostly around edges of staples.Visit http://otakuboy.com
$8.00

[000040] Conway, Gerry. ATARI FORCE #3 - "Pakrat Goes WILD!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9�" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has profiles of "Dart", "Babe", "Morphea". BONUS: Full of ads for classic videogames: Frogger, Q*Bert, Pole Position, Popeye, War Room and Masters of The Universe. ON CONDITION: Some light creases around covers, mostly around edges of staples. Visit http://otakuboy.com
$8.00

[000048] Various. ANALOG COMPUTING - DECEMBER 1984. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9�" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. 1984 was high-life for Atari Computers. Think about it. The XL series were riding strong and all those nifty new XE systems were just about ready to debut with their 6502c and FREDDY chips. You Atari fans know what I'm talking about. ANALOG was the BIBLE of that Atari fandom. And this issue is no exception. This one's a Christmas issue, with all kinds of ideas of what to stuff in stockings. Big article on Atari-style FORTH in here, too, along with a weather utility program and a game. BONUS piece is the big center spread ad for the OKIMATE 10, the first really low-cost color printer for home computers. Can you say, "Thermal Transfer"? I knew you could. ON CONDITION: The cover is a bit loose from the staples; you can't so much see it as you can feel it. There is an overall warp to the magazine and some creases along the spine. Visit http://otakuboy.com
$8.00

[000049] Various. ANTIC - DECEMBER 1985. San Francisco, California, USA: Antic Publishing, 1985. First Edition. 4to - over 9�" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. CES Buzz. That highlights this issue of ANTIC that hit the stands right before CES'85. What would Tramiel do? Perhaps an enhanced 800XL for 1985? Maybe a whole new direction for Atari computers. This

issue has an interview with Jack Tramiel, then-chairman of Atari. Look over the predictions. How many came true? Sample question: "Are you actually saying that within three years Atari is going to market a small, user-friendly computers with the power of a VAX?" Of course, we know the history. But this interview defines it more clearly. Also, ANTIC's ever-popular Software Library. ON CONDITION: Very light bumping on outer corners. The binding is tight and seems a bit warped as this issue inserts a thick card into the binding. Also, some color fade on covers and slight browning on some interior pages. Visit http://otakuboy.com
$8.00

[000053] Various. ANALOG COMPUTING - FEBRUARY 1985. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9�" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. ANALOG Mag was one of those Atari Magazines that rolled on during 1985. And why not? The new Ataris were out and it looked like a new set of 16-bit machines based on Motorolas powerhouse 68000 were set to debut at January CES. Wow. Analog kept us all in suspense and in tune! In tune how? Well, how about this issue with all the programming exercise and examples, including the ever-popular Ask Mr. Forth. Not to mention the really cool adventure game -- programmed and ready for you to type in BASIC -- based on a writer's adventures at Vandenberg. ON CONDITION: Very slight bumping and wear on the outer corners. Otherwise, a very clean copy with vibrant color. Visit http://otakuboy.com
$8.25

[000057] Various. ENTER - JANUARY/FEBRUARY 1985. New York, New York, USA: Children's Television Workshop, 1985. First Edition. 4to - over 9�" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. For a short, short time, the Children's Television Workshop even got a bit of techno-buzz in the mid 1980s. ENTER was a magazine geared toward educating kids about the wonders computers. But what could have been a large, preachy magazine about how computers are changing classrooms, is really a neat sensa-wonder publication about super cool things to do with your computers. This ish? 1984-In-Review! The year's "Greats & Glitches". Also, a neat piece on which companies are producing the dreaded "Q*Bert Clones". Plus, a big feature on what laserdisc players are going to do to arcades. Remember Dragon's Lair? ON CONDITION: Shelf-wear along the spine on both covers and along top of front cover. Slight bump on lower right cover. Visit http://otakuboy.com
$8.00

[000074] Atari, Incorporated. ATARI PORTFOLIO QUICK REFERENCE CARD. Sunnyvale, California, Usa: Atari Coporation, 1989. First Edition. 12mo - over 6�" - 7�" tall. Very Good / No Jacket. Unpaginated - FOLD OUT - Atari was certainly dynamic, wasn't it. After first creating one of the most successful home videogame systems ever -- not to mention their wildly popular computers -- they go on to create a really sturdy PDA-before-there-were-PDAs. The Portfolio was a nifty little handheld that ran a very sturdy and clean version of DOS, all in memory, for a pretty decent price. People gobbled them up. It's sad that Atari was eventually gobbled up -- and with it any hopes of a newer/bigger/faster Portfolio. But now they're appearing at thrift stores and antique houses. And, blazes, many of them still work. Fortunately, this Atari Portfolio Quick Reference Card will get you up and running in no time. It covers all the apps -- the calculator, address book, diary/calendar, text

editor and worksheet -- not to mention the Mini-Lotus-1-2-3 and all of its functions. ON CONDITION: One slight crease in the middle of the first fan-fold. Also a small bump on one upper, front cover. Visit http://otakuboy.com
$9.00

[000083] Various. COMPUTE!. Greensboro, North Carolina, USA: COMPUTE Publications, Incorporated, 1985. First Edition. 4to - over 9�" - 12" tall. Soft Cover. Magazine. Very Good / No Jacket. The big mag that wrapped up all the computing news from the mid-80s? (I mean, of course, aside from those stuffy magazines like InfoWorld.) COMPUTE! It covered everything 8-bit: Atari, Apple, Commodore. This issue contains -- ahem -- "TURBOTAPE: SAVE AND LOAD CASSETTE AT DISK SPEEDS" for the Commodore 64 and Vic-20. Other features: a lamentation over 1984's CES (how sucky it was), "1984 revisited" visits the hi- and lo-lights, plus a bunch of classic game ads, include Bally/Midway's foray into home gaming, and a _really bad_ ad for Summer Games from EPYX. Also: Enhanced Applesoft input. ON CONDITION: Very nice. Slight foxing on the upper left front cover. Otherwise, clean with good color and crisp conditions. Visit http://otakuboy.com

OK. I got the information from the Atari Profibuch TT.
I do not know the ""Hardware registers listing" by Dan Hollis",
but the profibuch says: The most significant word of the (long)cookie value contains
the information about FPU. That means bits 19,18,17 & 16.

The emulator does the following:
If there is a _FPU cookie, there is a suitable TOS. A TOS not abusing the line_f.
If bit 16 is set, there is a SFP004 compatible memory mapped FPU.
If both are true the emulator and the FPCP cookie are installed.

I found another reason not to change the _FPU cookie:
The emulator is not complete; fsave, frestore and exception frames are not implemented.

The emulator assumes that bit 16 is set by TOS. TOS touches address (ff)fffa40,
if it doesnt bomb, there is a memory mapped fpu.
You can use TT-Digger to see if your TOS is doing this.

I upgraded to TOS 2.06 directly from TOS 1.00
I do not know in which TOS version the cookiejar appeared for the first time.

> >Wow! It is a long time (4 years?) ago.

Actually, it was 6 years ago. :-)

> >Reducing the cookiejar size is obviously a stupid bug. :-(
>
> Henk, I apologize very much! I looked into this again,

Never mind. It is sorted out, that's what matters. :-)

I have no idee, this is the first occasion that somebody trying to use the emulator
comes to my attention.

Compatibility! I got bored by having to maintain 2 versions of some of my
programs.
The simple arithmatic is hardly faster then PureC's s/w float lib (which is
extremely
fast), but the more complex functions, as mentioned below, are!
Moreover, you can have the occasional float arithmatic
done by line_F and have some assembler routines for the heavy iterations or
large and often needed formulas.
Switching to TT line_f would need only relinking.

> >Until you mentioned this licom lib I never stumbled on a Line F using program

> >vorhanden ist.

Could this be the problem? The point is of course, that you have a 68000.
I have checked (before I even bothered to finish the emulator) that PureC's
libraries didnt confuse processor type with the availability of line_F.

....

That would be wrong. See above.
On the other hand, you might be able to see the difference by running a little
test program that does a large number of COS/SIN/TAN or the like.
Then the difference should definitely be noticable.

> >However, if this approach prevents particular programs to use the emulater,
there

Please do! That's why the FPCP cookie is installed. :-)
If there is a FPCP cookie, there is a _FPU cookie. Then set the 68881 bit, bit 18 of the long value, and see what happens.

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

hi,
thanks for the answer, now why will most stock ST programs not run on my stock falcon 030?
 i have been told its the window sizes, can a stock ST do the same window size that a falcon can? that sounds like what you are saying.
 if a stock ST can do the same size window, did most programmers do 32k as a standard?
 can a stock ST have the same resolution as a falcon, or is it a hardware problem?
thanks,
lance

To spooky for word's. I picked up a STFM version on Staurday but no software or manual's, so if any one has a copy I would be only to grateful, as well.

Mark

How hot should a MegaSTE's cpu get, I just recieved a corpse, sorta working.
The CPU is pretty warm, can't touch it for very long, and occasionally on
boot up get's 4 Bomb's (bus error?). Any ideas?

Mark

It can be a multitude of reasons.

Does the program bomb when run on the Falcon? If so, how many bombs do you get?

The 68030 is a little different to the 68k in an ST. Some of the early software used to make assumptions about hardware of the computer, and when that changes, the software will fail.

For example, the 68010 (and following 68020, 68030, 68040 etc) changed things slightly, so that you could never get access to the CPU status register from user mode (where non-OS software should be running). Accessing it from user mode would cause the CPU to issue an exception, and the system would crash.

Or the software would assume that the screen was a set size or at a set location, and access it directly. When the hardware changes (STE/MSTE/TT/Falcon), you have software that either messes the screen up, writes over unused memory, or memory owned by another app. This can cause the system to misbehave/crash.

Or, if you're running a ST-High sized screen, but doing it in colour, then the ST software will assume that "ST-High (or 640x400) equals Monochrome". Or that "Not-ST-High equals colour equals 640x200"

Sometimes it can be due to the hardware registers in the Falcon being a little different to the ST, so what was a good assumption to make in the early days can be a marginal/bad decision on later machines.

Mostly, it's the shortcuts that programmers made that'll cause the software to fail.

hi,
thanks for the answer, now why will most stock ST programs not run on my
stock falcon 030?
i have been told its the window sizes, can a stock ST do the same
window size that a falcon can? that sounds like what you are saying.
if a stock ST can do the same size window, did most programmers do 32k
as a standard?
can a stock ST have the same resolution as a falcon, or is it a
hardware problem?
thanks,
lance

>actually like?

Thats not possible, there's no program around that could possibly show what the DSP hardware is capable of, so in short, NO!

Hi

I have quite a few Atari games/hardware etc. for sale.

```
You can look at: www.the-asx.co.uk

but the site is out of date, and I have just lost the new site I was
working on. So if you are after anything let me know and I can tell you
if I have it or not:)

--                            Cheers! For Now

I noticed this incredible heat from the
Mega STE's CPU several years ago.
I also found that I couldn't touch it
for long.

I put some water on it while running
and watched it evaporate. I think next
time I open it I'll stick a heat-sink there.

It looks you are refering to the fixed amount of memory the ST's use for the screen as a whole. This is exactly 32000 bytes.
640*400*1/8, 640*200*2/8 or 320*200*4/8
Very early programs may have used these values for private screen saving or x*y calculations.
such programs will certainly not run correctly on other machines having different resolutions and/or using diffrent video hardware.

Correct programs obtain these values from the VDI, the operating system layer that handles screen output.

The latter should run on any atari or clone, independent of video characteristics.

A 'window' is the part of the screen surrounded by all those nifty thingies like arrows, sliders, title bar, closer, mover etcetera.

Sound's good, the CPU is actually rated at 12Mhz? Is this normal? My other 2
Mega's were FN16's.

Answered my own question, yes some were 12Mhz, probably the early ones. This
one has had the ROM's replaced, was probably tos 2.05 originally. I heard a
Cat pissed on it? There is a little corrosion too.

8 or 16 bit?

There's a huge archive of 8 bit Atari games on Holmes' site.

if you are doing it through the RF connector on the ST,

you also have to set the TV system on the TV correctly as well, not only the COLOUR SYSTEM.
UK pal ST's will be SYSTEM "I' where as the rest of the worlds PAL is system "B/G"
If its a SONY TV, you have to set this at the TV you cant do it from the REMOTE.

Hope this helps.

Failing that, you can make a cable to plug into the ST's monitor port to
connect to an RGB separated Scart input on your TV, (superior quality
picture) or you there is a pin in the monitor socket for straight composite
video, which is either PAL or NTSC>

IF, your VCR or satellite decoder's got an RGB separated SCART connector,
most satellite receivers do, but if your spending that much for one of those
I guess your gonna have a decent TV anyway :)

oh, and you'd have to fabricate a cable to do this

And its also possible to use an ST's monitor on an Amiga 500, I did this one
day when my friend got one from the rubbish tip and needed to test it, just
needed to know the pinouts and away it went.

I didn't mean something that emulated a Falcon.. That's like emulating a P133 on a 386. I did see a Tos 3.06(?) in .PRG format, meaning you could run it as an auto program to override the tos roms, though your origional tos still remained the predominent "controller" so to speak. I used to use it because I preferred this desktop to my measly, but still reliable rainbow tos desktop (1.4)..

That, I believe, clarifies the point some;)

Early ST's supplied with 150ns 256K*1 Dram's some suffered
from sparkle on display.

Later Models with blitter capability supplied with 120ns or better
devices.

Memory access timing for ALL the ST series is fixed because of

the screen refresh. Ie 500ns cycle, CPU gets 250ns and Display
gets 250ns. So therefore the faster modules ie 70 & 80ns make
no difference to the speed of the machine. (it was a few years
ago since i last did any work on these machines so it could
be 500ns per cycle, so no replies of 'pillock' please).
BTW the Mega Ste with it's 16Mhz clock still uses the same
cycles and only sees the ST Ram on an 8Mhz cycle. (This is why
turning the cache on makes the difference).

Just thought I would throw my 2p in.

Yep most RGB monitors can be used on a variety of computers, the philips
chasis was used in many Atari and commodore monitors:)

Hi folks,

I have a Ataridisk (from a friend) with documents, the extensions of
this documents are DOC. I have now two questions:
First: How can I convert this documents in MS-Word files? I hope they
gives a way to convert this kind of documents!
Second: How filesystem are used under atari-st? This is very important
for me, because when I know this I can try to mount the disk under
Linux. And I hope this is the first step to analyze the documents.
A third important thing for me is: Please forgiving me my bad English!
J
Many thanks in advance!
Many greetings on all Atari-User from South-Germany!
A.Geissler

Hi Shiuming

>> The CPU is pretty warm, can't touch it for very long, and occasionally
>> on boot up get's 4 Bomb's (bus error?). Any ideas?

>I noticed this incredible heat from the Mega STE's CPU several years
>ago. I also found that I couldn't touch it for long.

Whimp.. How else will you get a motorola tatto on your pinky..

Actually i did this some years back to a faulty memory chip and had a reversed 'Monsanto' tatoo on my fingertip for some while. If i'd took up burglary it would have left some interesting 'dabs'. :-)

>I put some water on it while running and watched it evaporate.

Pillock, thats not how you 'soak test' stuff :-)

>I think next time I open it I'll stick a heat-sink there.

And...... :-)

Cannot help much. Some, but not all, .doc files are ascii files, with ruler-line headers in ascii.

An Atari OS asks what disk format is used. The only MS-DOS machine that does that is Windows 95, because Windows 95 was available on floppy disks, and Microsoft wanted to use 1.62 meg disk formats.

An Atari format may be single sided, double sided, DD or HD, with tracks from 80 to 85, and sectors per track from 9 to 11, or 18 to 22 if HD.

I would first look for a Windows 95 machine, and see if they read there, and if they do, put them on a disk that Linux can read.

Most early Atari formats use one field of the boot sector differently than MS-DOS, and later ones use the same thing, and should be readable by any DOS machine, if you can tell it the tracks and sectors.

The easy answer is the Windows 95 machine.

Please forgive my non-existent German.

```

I recently obtained an "AERCO easieST SOLDERLESS RAM"
board.  It appears unused but did not come with any
instructions.  The board has 32 20 pin DIP Sockets.
It attaches to the motherboard via 2 14 pin DIP headers
and a 68 pin PPGA header that has a CO25912-38 mounted
on top of it.  I need to know what type of RAM chips
it takes and where to connect on the motherboard.  If
anyone has any info on this board I'd really appreciate
hearing from you.

Boyd Staley

All the other TOS's I have seen on the web. There is a program that, when
run on an Atari, will dump the TOS resulting in an IMAGE file. I use TOS
3.06 and have dumped it to an IMG file using this same program.

Hi all I am trying to connect my 4 meg STe to my PC using the Ghostlink software and a standard null modem cable.
The cable connects my ST's modem port to the PC's serial port on com 2. I have check that com 2 in installed and configured correctly through windows, and configured my ST's control panel to "8 bit, 1 stopbit, no parity, no flowcontrol" as directed by Ghostlink's readme file.

When loading the STMASTER.PRG I only have the option to set the channel to "standard" I have no control over the com port used, I then assigned ST drive icon's to my PC's drives. I installed the new drives as desktop icons and tried to use them but my ST refuses to received or send data to my PC all I get is the ST busy bee sybul for an indefinite period of time. The only change to this was when I installed the PC link using channel 3 on the STMASTER.PRG this caused my ST to crash when I try to access the drive with 4 bombs.

Am I running the PCSLAVE.EXE and STMASTER.PRG and the same Baud speed of 300 (slow connection to try stop errors) I have also tried altering the speed and played around with the flow control functions. Flow control isn't suppose to be used but it makes no difference at all I cant make my ST talk to my PC at all. Please help I'm going mad trying to figure it out :O(

The original TOS in my TT is 3.01, but among the files on the hard
drive was TOS 3.06. I haven't bothered with it because I use Magic and
I've never been comfortable with the loader program (which isn't
included here).

Also, because this was G�nter Minnerup's machine, I don't know whether
this is a german or english TOS. Would anyone like to check it out?

[Update] I've just checked it out in Edhak's Hack mode and it's
definitely english...

I guess your cable is O.K?
Maybe you should try using HyperTerminal on a PC as you already have it in
Windows, and an ordinary terminal program on the Atari (I think there are

some good ones available for free download)
I did this with my old Apple Mac and it worked great.
Just go through all the options, it should be intuitive...

>Hi all I am trying to connect my 4 meg STe to my PC using the Ghostlink
>software and a standard null modem cable.

I've had this setup working in the past. May I make some suggestions?

Get hold of PARCP, a link to Petr's site was mentioned in a message in comp.sys.atari.st very recently. This program allows file transfers over the parallel ports using a slightly modified cable, and is much faster than using the serial ports.

However, if you're dead set on the serial port solution then make sure that you have HSModem installed. That will ensure that the bugs aren't causing your problem (English docs on my web site, MISC section, HSModem from ftp sites such as ftp.chapelie.rma.be). Try running a terminal program on each computer to make sure that you've got a working null modem connection before tackling Ghostlink.

HTH.

I have a few questions too (if you don't mind),

I can't understand their web site so these questions may sound silly, I am looking at upgrading an Mega STE (maybe with a Crazy Dots card).

Are these people still selling this stuff?
Anyone know what the PuPla2 does?
Anyone have a clue about the price (including PuPla/2 and Frak/2)?
Anyone know how hard it is installed?
Anyone want to sell me one?

Steve, Why is yours not running at 50Mhz?
Did you fit it into the Mega case OK?

Mark

You shouldnt be able to access any TOS on the web as they (except TOS 1.0) are rom images which were never intended to be ripped off the chips and uploaded by pirates...

As has been mentioned TOS is still copyright but have a look on;

www.atari.co.uk

They have 3.1 and I may try and get that burnt onto some chips as the German
version I have is really annoying, don't know what the law is about
replacing a version with the same version just different language........

Mark.

hi guys,
one more thing maybe,
will the pak'ed ST give the same resolution as a falcon.
i was told that the falcon uses 128k windows, and ST's use a 32k
window, does this change when you PAK it,
thanks,
lance

No, the st will only use 32k unless you have a vga card, etc. The Falcon's video is fully programable, so you can use as much ram as you like (videl chip), there is no 128k limit. Otherwise 768x576 True colour wouldnt be possible, needs 884k.

Mark

Hi Mark,

> Are these people still selling this stuff?

Yes, they do.

> Anyone know what the PuPla2 does?

You need it, if you want to run the PAK with 50MHz, without it the PAK
(and your ST) ist stable only up to 40MHz.

> Anyone have a clue about the price (including PuPla/2 and Frak/2)?

It�s about 200 USD.

> Anyone know how hard it is installed?

It�s not so easy, you have to remove the CPU and to install a socket
instead. The PAK itself has very much parts, so you shoul do it only if
you have expierience in soldering!

> Anyone want to sell me one?

Sorry, but I won�t remove my PAK.:)

Ciao

Marc-Ant�n

Hi,

How have you got that resolution?

I am running in 800x608 16 colours. Anything above the standard and it wont
let me use any more than 16 colours.

Tim

I tried Ghostlink to access the hard disk of my PC. The direct access like any atari st drive is a good thing but It is too slow and often crash. I tried also ParCP3 which is faster but It need running a program and is only a transfert (need free space on local hard drive ...).

Is there a soft like ghostlink and as fast as ParCP ?

Thanks.

Guillaume.

I have seen the schematics for 3MB mod, and have also heard that it
was unreliable- if there were "holes" in the Desktop then there were "holes"
in the RAM too... and, looking at the schematics, one can see that it
was quite possible that the logic was too slow- but probably that could
have been cured by using short signal lines and substuting 74LS** chips
with faster 74F** or 74ALS** (checking, of course fan-in and fan-out
loads)...

The best price I have is �300 (admittedly fitted), were did you get that
price from? how much would someone charge to fit one?

mark

Hi Mark

>I can't understand their web site so these questions may sound silly, I
>am looking at upgrading an Mega STE (maybe with a Crazy Dots card).

Some Crazy Dots cards require a upgraded GAL to be able to function with the PAK, which has proved impossible to obtain!!.

>Are these people still selling this stuff?

>Anyone know what the PuPla2 does?

Its a buffer board, corrects some timing anomolys and depending on what
GALS you have allows the MB to run at 12Mhz

>Anyone have a clue about the price (including PuPla/2 and Frak/2)?

I got change out of �900 for my setup.

>Anyone know how hard it is installed?

I recomend dealer installation, intimate knowledge of the Atari is a
bonus.

>Anyone want to sell me one?

You can have mine for �2500

>Steve, Why is yours not running at 50Mhz?

I never progressed to 50Mhz as Karl told me of possible prob's with the
serial ports.

>Did you fit it into the Mega case OK?

Its in my MegaSTE, this requires that the PSU is moved to external on
extension leads.

Why not? If you look at Milan's
official German brochure you'll see
System Solutions is listed as its UK
agent. Or would you prefer to buy
from some grey importer who takes
the money and runs?

See www.atari-workshop.co.uk
for ordering details.

Hi Shiuming,

It's not because of anything personal, just that they never answer their phone or e-mails. I understand that many SCSI cards are suitable as long as it uses a certain chip set. I'll try them again.

Hi Mark,

> The best price I have is �300 (admittedly fitted), were did you get that
> price from?

Directly from the wrs homepage, all components (PAK, PuPla, FRAK) costs
about 400,- German Marks, so it�s about 200 USD.
But you can�t get the assembled components in the moment, you have to
build it your own.

Ciao

Marc-Ant�n

Most of the TOS images you find on web sites are for running with the Emulators, as there is no TT emulator no one want the TOS image, this also applies for Falcon TOS images (although some sties do have them, for what reason I do not know).

Mark.

Thanks to every one who has tried to help me on this problem so far, I am still unable to connect my ST and PC using ghostlink.

I am using clean dos (F8 from boot up) but still no luck, I'm not familiar with hyper terminal and I can only seem to make it use my PC's internal modem.

PARCP sounded like a good alternative but all the links on the web to that particular software seem to be broken (or they are when I try to download it)

Does PARARALINK OR PARCP allow the PC drives to been used from the ATARI desktop in the same way that Ghostlink does?

I am using the Atari's Modem port to connect to com 2 with a standard null modem cable is this the correct setup, also how do I tell the Atari which Port I'm using my control panel doesn't let me assign a different port.

If anyone can shed more light on the subject please contact me.

This is how I understand it but I could be wrong (probably better to ask him), he only has one board coming out for the Falcon, this is the CT060 (any others have been put on hold).

However you can put a number of different version of the 68060 chip in it.

EC (no PMMU or FPU)
This is a real cheap version but should give massive speed increases as long as you don't want to run things like Linux, Mint in protected mode, Aniplay etc. Cubase should be really quick like this and any general progs should run fine (Papyrus, CAB) just with massive speed increases.

LC (no FPU)
In general most things should be much much quicker, you can also get higher clocked rating versions of these chips you may be able to overclock them to 90Mhz+ (rated at 75Mhz). All programs should run but ones that use the FPU will be much slower than their 'Full' counterpart as these instructions will be emulated.

Full
These will run the lot with massive speed increases, however the 'Full' versions can only be overclocked to a max of 72Mhz (rated 50Mhz although they do go up to 66Mhz), so some programs would appear faster on the LC while others will be quicker on the 'Full' version.

The calculations to work out which is best to go for is tricky, for the EC it is basically budget with this version being nearly 50% cheaper. As for the LC and 'Full' version I would put it more down to application and use, if you are going to be running Linux, CAD and playback of MP3s then maybe go for the 'Full', if you want massive speed increases but do not want to be limited then go for the LC (which is what I think I will do). There is also the problem of not being able to find the chips, if a batch of 'Full' 060 rated at 66Mhz can be found then these should be the best option (in my opinion).

Mark

Hi Shiuming,

I've just phoned atari-workshop. The guy was very helpful, and has been trying to contact Milan for some months. No response. We left it that I would try and get some one in the know to recommend a PC1 SCSI board (with the correct chip set) and he would get one for me. SO any recommendations for a PCI SCSI board for my Milan I.

Cheers from Wales, where the leeks come from

Bob

Nice new web site, but there's still no sign of the new version of Gemtrade
that we've been promised.

Anyone know what's happening?

AFAIK the CT060 boards just plug into the Falcon's expansion bus, no need for any soldering etc.

Falcons which have been fitted with Nemesis or a CT2 will have to have the installation reversed to fit the CT060.

Any PCI card with a Symbios/LSI logic 53C810 or 53C810A chip on it. Examples are Asus SC200, Sym20810, CI-2520 and many no-name boards.

That's also the reason why I don't have a Milan.  I was prepared to
buy a Milan, El at SysSol asked Axro about it but he didn't get a
response.

Now that is bad service...

....And something Czuba doesn't like to boast about is that it needs
a PC type PSU or one that can supply 3.3v@8amp. CT060 goes in the
place where the old PSU went.

Hungry old beast the CT60 sounds like :)

(Well for an Atari that is)

PS. A week ago my TT stopped working. As I had done some experiments
around ROM, I thought it was the memory that had broked. A friend of
mine who owned a TT had sold it last year so I had no source of TOS3.06
to program new EPROMs. As there are many TOSes available on the i-net I
was _just_angry_ I could't have got the TT TOS and that's why I
asked'bout it. But further check showed ROM works fine and after small
repair I have my TT working again. Is everything clear now, Steve?

Kylo :-)

I want to transfer some files from an STe (with SCSI Zip and EZ135
drives) to an Apple Mac G4 (which has no floppy drive).  I've tried
hooking up the Zip drive to the Mac's SCSI card, but the Mac won't
```

read the discs formatted on the Atari, and the Atari won't recognise
the Mac ones. Is there some way to do this or am I barking up the
wrong tree?

Failing that, are there any programs around to let me connect the
two machines via their modems with a bit of phone line and send
things back and forth with FTP or similar?

Gary.

Try to create an pc dos format zip disk on atari (or mac)
Copy your data on the (pc format) zip disk an you mac read it ;)
Same as here.

> Failing that, are there any programs around to let me connect the
> two machines via their modems with a bit of phone line and send
> things back and forth with FTP or similar?

Other way i used here is to connect both machine to ethernet.
(Ethernet rom port adaptor from elmar hilgart)

On falcon, i doasn�t had an ste, runs ftpserver 0.7
With an simple ftp client on mac i�m connectet to some folders on falcon
and that�s the way i transfer all data and programs or some else.

Not realy fast, but it works in background :)

Regards, Robert

It seems like most PC shop staff are
like this anyway... The nonsense I've
heard spouted by even some of the
more "prestigious" dealers in central
London (no names mentioned:
Mico Anvika...)

Hi Kylo

>If you don't read the post exactly and/or don't understand what's up
>then don't reply, ok?

If you'd have been a bit clearer as to your intentions you may have got a
better responce.

However as you were very vauge what conclusions are there to be drawn.

Where can I find a "bomb catcher" for MinT/MultiTOS?

I tend to crash many times per hour when using MultiTOS, and then I end up rebooting roughly once or twice per hour, due to the machine no longer accepting input from the keyboard or mouse. Using SingleTOS (AES 4.1 loaded from disc, or the TT's original AES 3.1), this only ever seems to occur perhaps once a day.

As my predominant use of the TT is for software development, this hang/reboot sequence is quite annoying.

The ALERT accessory supplied with MultiTOS was useful, telling me where the program crashed, but wont allow me to get in and edit/examine the program and either get it running again or kill it.

I run with memory protection turned on, on my TT with MultiTOS (MiNT 1.15.[5? 9?] and AES 4.1), and usually have 13+ megs of free ram (12+ of TT, and <1 of ST RAM) when it misbehaves

HI!

It's going to be interesting with either this or the Tempest, on how fast we can get MAME running on a Falcon now! As a comparrison, my P166 runns games from 1984 and earlier quite well, and those are the games I want to play.

One advantage we have is that the Falcon has the RGB out, so we don't need any convertors to run an arcade monitor-except maybe attentuation of the Falcon's RGB levels. Or, using my VideoTurtle and a nice big 26" S-Video TV to play the MAME on the Falcon!

Regards,

Jim

Axro has never been a Milan dealer - they *wanted* to sell the Milan II, but for a Milan I, they are definitely the wrong people to ask.

Ive had it working under windows. I actually had it using shared drive's too. I could access all my PC's ffrom the Atari that way. Not brilliantly reliable tho, work's alot better under DOS.

Hi

I would like to apologise to anyone who has been waiting for replies to emails or enquires etc.. over the past few months, this was due to ill health.

But during an upgrade I blew the motherboard, hoping it's just motherboard, on my main machine:(this means I don't have access to any email or addresses sent to me BEFORE or ON Sunday 28th January.

Talk about bad luck, I reinstalled an operating system on the laptop and it wiped out my entire hard drive partitions including the updates to my web sites and my entire inventory of Atari gear:((and the web sites were nearly ready for uploading...

Anyway, if you have written to me on an urgent matter, please rewrite and I'll do what I can.

Steve <><

Well, OK, whoever, but the point is still there that I wanted a Milan
and SysSol got no response.

Probably in case you have TOS 4.01 or 4.02 instead of the latest
version. Similarly, there ought to be a 3.06 for those with 3.01 or
3.05 (like me).

Of course, Magic makes the TOS upgrade redundant anyway...

Is there any problem in using an EC or LC if you already have an FPU?

I'm asking because I'm very interested in the proposed CTT60 for the
TT - which is the accelerator (to 64MHz) plus TTRAM board (to 128Mb)
for E150 (~100ukp + fitting). The only problem with the TT board is
that it needs soldering to 12 places on the MB IIRC

The orriginal FPU will not work with the CT060, I also assume this is the
case for the TT version too.

The web site is a bit confusing at the moment, I fell for that one as well and then got told off. The CTT was about E150 BUT when it used the 68030 which is much much much cheaper than a 060. The CTT60 will probably cost just over �100 and then you need a CPU which is about �140 unless you go for the EC version (about �30).

At present this is just a concept, I do not think there is any formal design in place but I imagine you will find that the CTT60 is basically a CT060 with a few mods.

One should also note that there is a very limited supply of EC chips at the price stated and it would appear that 75% of them have already been requested by the CT060 group. What I am trying to say is I do not think there will be any EC chips left when the CTT is made so full 060 will be needed at a fuller price (�240).

I am also looking for TOS 3.06 UK to upgrade the German TOS which is
annoying me.

Mark.

Hi

Recasing my Falcon, so I thought it would be best to change the LAN style plug with an adaptor to a standad 9 pin D-type plug. I have the pinouts, so I connected :

9pin D-type		MiniDin 8w LAN
5	GND	4
3		6
2		8

I then connected this up to my Modem and the Tx and Rx data lights are always on.

This port is to provide a simple Null Modem connection to my STe. This brings me along nicely to my other two questions.

Does only ground, Rx data and Tx data need to be used as flow control doesn't need to be done (or without the use of the RTS and CTS)

How do I map a drive/printer under StinG with Magic?

Thankyou ever so much.

Best regards.

Lyndon Amsdon

That'd be a bummer if anyone wrote some useful utility that used the
FPU in a TT (hint...)

Personally I'd be just as happy with an 030. I'm not entirely sure

what I'd get with an 060 that would be so much better.

> At present this is just a concept, I do not think there is any
> formal design in place but I imagine you will find that the CTT60

I'd guess so too.

> already been requested by the CT060 group.

I've got my name down alreasy, so I'm happy enough.

I just hope time isn't wasted going straight to an 060 when we need to have any kind of successful accelerator out there now. The 060 could still be an upgrade IMO.

Hi there,

I CANNOT get FreeMiNT to run on my Falcon030! HELP!!

I have kernel 1.15.5, 030 version, and AES 4.1...

I get this whenever I try to start FreeMiNT...

```
Reading 'mint.cnf' ... 7735 bytes done.

pid 0(MiNT): MEMORY VIOLATION: type=hardware AA=FFFFFFFF PC=181544 BP=180384
pid 0(MiNT): operating system killed
FATAL ERROR. You must reboot the system.
```

I have run earlier versions of MiNT (upto 1.12) but have not tried since then.
I have a PowerUp2 accelerator, 14MB of RAM, and an FPU. Other than that
it is a
stock Falcon. What is going on?

Please EMAIL any help, as I only get NG feed about once every 2 weeks
(the posts
usually expire before I get to read them!)

Your help will be be MUCH appreciated...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Or a Falcon for that matter. POV-ray is the only thing I've got that
does...nothing commercial I have seems to!!

> Personally I'd be just as happy with an 030. I'm not entirely sure
> what I'd get with an 060 that would be so much better.

If you got a 'full' 060, you would get a CPU that runs POV-ray 90, yes
90 times faster at 60 MHz than a standard 32MHz 030 and 68882 combo.

Not sure why you wouldn't want that quite frankly...I do!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

What I find amusing most of all, is that since Atari abandoned the whole 68k
range of CPUs in favor of consoles, it's the pirates that pretty much saved the
Atari and made it as lovable today as it always was.

We all know that, in the day of days, piracy didn't help the Atari. This is the
inevitable truth. However, the very fact that the ROM image dumps are out there
and that people are using them to keep the nostalgia of what once was alive,
where's the harm?

Remember, Atari dumped us before we dumped their rom files.

Just my opinion, not that it really counts for anything.

Don't worry, Motorola's 882-library for the 040 and 060 ensures 100%
compatibility.

AFAIK, commercial: DynaCADD, Calamus, programs generated by
Turbo/Pure-C/Pascal, by GfaBasic (with Licom library)...

PD: POV-ray, Lindner TeX, programs generated by GNU C, some astronomy
programs, STarBall game...

There was also a "FPU-patch" which, as far as I could understand,
was supposed to patch any Pure-C program to use FPU (but I could not see
any difference when applying the patch).

But still, few apps use it. I suppose that NVDI, for example, would benefit
from FPU, and a long time ago I was sorry that Formula I GP game did not
recognize a FPU.

What's even worse is that many software authors seemed to think that the
presence of a FPU implied the presence of a MC68020 or higher (which need
not be so) and compiled their software accordingly. But there can be
"memory mapped" FPUs, like the one I have in a MegaST, and with a LineF
emulator it can simulate a co-processor FPU. But I can only use it with
DynaCADD, Prospero FORTRAN, old POV-Ray, an astronomy program and a
STarBall game.

You can't always expect to be able to just install a Line-F emulator and run FPU programs.

Atari, when they designed the original 1985 pre-ROM ST TOS, used the Line-F vector as a shortcut for the "cleanup" portion at the end of some of its OS calls (it was their way of "executing 16 instructions within an exception handler, instead of doing three or four instructions in their TOS code"). To me, this seemed more like a "it works now, who knows if it'll work tomorrow" hack that is often implemented when you're under time-based constraints ("launch date is three days from now, but we still need to do two weeks worth of work to get it saleable").

And, IIRC, there was also a "call function number X" capability built into it. This capability was made known, and made use of by some programmers when the ST was in its infancy.

(It also appeared in the Abacus "ST Internals" book, complete with a commented listing of the code used to handle the F-Line exception. This further drove the nails into the "F-line instructions are only for co-processors, F-line exceptions are for coprocessor errors" that Motorola preached)

I cannot recall how long this capability lasted in TOS, or was implemented, however.

It wouldn't have been possible to use this on a TT with FPU, (the FPU uses F-Line opcodes for its own instructions, most of whom clash with Ataris use of that vector) so the use of that hack probably died around 1988/1989 with Rainbow TOS and STE TOS (1.4 and 1.6 respectively)

> That'd be a bummer if anyone wrote some useful utility that used the
> FPU in a TT (hint...)

The full 060 (and the 040 I think) only supported the main FPU library and the rest was emualted, I could be wrong but I think there is also a library for the EC version to emulate the lot. This will enable programs to run if they use the FPU but it shoudl be noted that this will be much slower (relatively) comaered to the full 060.

> Personally I'd be just as happy with an 030. I'm not entirely sure
> what I'd get with an 060 that would be so much better.

It will be much much much quicker then an 030 running at the same speed, and lets not forget that if you get an EC running at 75Mhz then you shoudl be able to push it past 90Mhz (the 68EC060 75 is a rare unit though).

> I just hope time isn't wasted going straight to an 060 when we need to
> have any kind of successful accelerator out there now. The 060 could
> still be an upgrade IMO.

IF I understand what you say (worried about future upgrades), I think the next step is the PPC, most (if not all) other platforms (not I say platforms and not embedded apps) have gone to PPC.

Mark.

I want to upgrade my STE from 520k to 4 mb and I have access to some 1mb simms from an old PC but need advice as to whether the simms need to be parity or non-parity and whether they should be of a particular speed.

I have 7 1mb simms in total but they are not all the same.

There are 4 identical ones which contain three chips on each simm (I presume this means they have parity) and the speed would appear to be 70ns.

One has 9 chips (parity?) and would appear to be 60 ns

One has 9 chips and would appear to be 80 ns

The other has 9 chips and would appear to be 100ns

Are any of these suitable for an STE?

Yes, the 9 chip is 8+parity and the 3 chip is 2+parity, best to try and use identical chip's, parity is not used by the ST at all, so don't worry about it.

Just about ANY 30 pin, 1 Mb SIMM will work for the STe.

Parity doesn't matter- The STe doesn't use parity, if the SIMM has the extra parity bit, the STe will just ignore it.

Speed also doesn't matter. any of those SIMMs listed are far faster than the STe needs (`150ns is the spec for an ST), so any of them will work.

It's NOT however, a good idea to mix types, styles and speeds.

I would go with the set of 4 identical types.

All correct except it is actually 120 nano seconds:-)

> modem.

If you are using Win98 then double click the HyperTerminal icon, enter a name (STConnect) then click OK, change 'Connect Using' to 'Direct to COM2' and then click OK. You should then have a standard set-up of the port which needs to be identical to the STs setting.

> PARCP sounded like a good alternative but all the links on the web to that

Make or buy the cable and plug it in and off you go, really simple and quick.

> Does PARARALINK OR PARCP allow the PC drives to been used from the ATARI
> desktop in the same way that Ghostlink does?

Not Parcp, don't know about the other.

> I am using the Atari's Modem port to connect to com 2 with a standard null
> modem cable is this the correct setup, also how do I tell the Atari which
> Port I'm using my control panel doesn't let me assign a different port.

The Atari does not need to know what port you are using on the PC, this sounds fine.

The port is not that stable and it would be a good idea to investigate HSmodem to replace some of the bugs in TOS, unfortunately HSmodem is not for the faint hearted.

Mark.

I sent a message to him a couple of weeks ago (24 Jan) at 11:00 in the morning and the reply (from El) came at 3:45 that afternoon, no problems.

Mark.

Hi,

Is there anybody out there using a scan doubler to connect his ST to
a modern multisync monitor ?
I found two of these devices (with and without flicker fixer ?!)
advertised at a 'software hut' page but haven't the slightest idea
which of them would work better (or at all) with my ST and I suspect
that since 'software hut' is an Amiga store they won't know either.

regards
Gerhard

I am aware of that, but as I use TOS 2.06 there is no danger anymore-
and the docs for the Line-F-to-memory-mapped-FPU program say so, too (i.e
it was in TOS 1.0-1.4 only).
Btw. it would be better to say "stupidity in TOS" than "capability"...

Anyway, it seems that the only thing that the "Line-F emulator" enables me
to run is a little demo that came with it. I suppose that the authors
neglected to use the cookie-jar correctly: there is a _FPU cookie installed
by TOS, and cookie's value indicate whether a memory-mapped or a Line-F
coprocessor (or BOTH!) is present, and is there a software emulation.
But the emulator does not change this cookie at all, so there may be
applications which would not know that a Line-F FPU is there, emulated,
at least (I think e.g. Licom lib. for Gfa Basic is supposed to check _FPU).
Instead, the emulator installs its own cookie, which passes unrecognized
by anything else, and besides, it REDUCES (why?) the size of the cookie jar,
e.g. from 16 to 15, or from 32 to 31 or whatever...

(Henk Robbers, can you comment on this, please, you were one of the
authors of the FPU emulator...)

Only a select few had sipp's, mostly very early STe's. Probably around 2-5% in total.

Wow! It is a long time (4 years?) ago.
Reducing the cookiejar size is obviously a stupid bug. :-(

There is a good reason not to change the _FPU cookie:
Pure C programs, when compiled with PCFLTLIB.LIB, can use the memory mapped
FPU directly. In that case the _FPU cookie must report a memory mapped fpu.
And that is exactly what is supposed to be your machine.
The emulator is a serious bottleneck. Addressing the memory mapped fpu directly
is much, much faster.

Until you mentioned this licom lib I never stumbled on a Line F using program
that actually checked the cookie jar. The reasoning is: It is very cumbersome
to implement both line_F and memory mapped and S/W in a single program.
Most programs using Line_F cant do anything else.
So if you dont have the emulator, or a real coprocessor fpu, you cant run the
program anyway.

However, if this approach prevents particular programs to use the emulater, there
is no reason not to provide a version that emulates the cookie as well.

Because the emulator is asked to lie to you ;-), there would of course be
absolutely NO guarantee. !!!

Just to confuse the issue, I just repaired an STF, with 150ns Dram in it, go figure?

I've seen it as 150ns for STFm machines and 120ns for STEs.  Also I
don't think /any/ STF had sipps, only STEs :)

Does anyone know where I could get a utility for the Atari ST or the PC
to convert Atari Page Stream 2 *.DOC files to PC *.BMP files.

The business I work for is trying to retire the Mega ST 2 with 4 meg
RAM, 40Meg removable media hard drive, SLM-804 laser printer, and a SM-
124 monitor.

Any help would be appreciated

Hi,

I bought this without realizing it didn't have a built-in modulator!, so I couldn't test it, but I recently managed to get a RGB/Scart lead. It booted with a black screen. The system works, I booted a game disk, but the screen is black. I pulled the video chip (Shifter?) and put it into a 520STFM and it works. Tried the chip from the STFM on the STF, but still black screen.
The solder looks ok on the bottom of the motherboard, so I'm stumped!

Thanks,

--Bill.

hi mark,

if i read you right you forget 1/2 meg, what a waste. this must be a
operating, or hardware limitation correct?
there is no patch for the O.S., or the hardware?
or should you just add another 2 megs to the other side?
thanks,
lance

Hi,

I've 14mb and it was only 500kb.

I'm actually getting a sneaky suspicion that it depends on The OS that's
running. Don't forget I am using the standard Gem desktop.

Tim

You can get the driver directly from me, provided you manage to get the
money to my account - I do not accept non-german checks any more, due to the
enormous bank costs.

Hi Michael,

You told me this before, thanks. Just what do you mean by a german cheque? If
you can quote me a total cost in DM including all extras p & p etc, at least
that will be a start. I bank with the Nat West and I'm sure they have some
arrangement with a German bank.

Thanks again,

Bob.

You can have 2.5 Mb in a STE but the problem is due to the OS, there are
patches that will allow you to do this.

Mark.

...which I'll just add that they are not that good for compatability
under TOS and even worse for games. I removed my two 256k simms in my
STE back then to give me 2mb. It was worth the small loss in RAM.

hi steve,
cool! whats it like, will it give you a fast operating enviroment?
does it enhance the operations of good software.
do you use your machine for web surfing?
how does it compare to a falcon?
where can i get one,
thanks,
lance

They're amazing!  Go to http://www.wrsdesign.de as I think they still sell
them, along with a lot of other goodies.  Faster than a Falcon, but
lacks the graphics unless you add a graphics card.  Mega STe is the
only model in the ST range to support a graphics cards easily via the
VME bus (also found in the Hades and TT).

Nor I had problems with fitting my aixTT ram card to the socket (my TT
has a daughterboard as well). By the way, one should say that the card
covers a part of the cpu and gets warm a bit. But everything works fine
though.

Once I had a debian-m68k installed on my TT. It worked, but really
slowly. I don't know how to explain it, but eg. executing cp
file_1MB_big somewhere took much more time than on a bare TT (under
TOS).

info again please,
i take it the 68030 upgrade will only work on STE'S, not a stock
520,1040, or mega's. if so is it because of the better tos, and color
palette?, or hardware architecture?
thanks,
lance

>How can I get a 3.5 floppy to work on my Atari (if possible at all)

By changing its ID from 1 to 0. That will be either solder pads, a jumper to
move, or with a floppy drive cable which has the 0 and 1 drive ID wires (I
can't remember the proper name for this) twisted. A PC shop should help.

We are talking Atari ST here are we?

Hi Lance

> cool! whats it like, will it give you a fast operating enviroment?

It is very fast, and once combined with NVDI and MAGIC it is blimey fast.

> does it enhance the operations of good software.

Well at the moment ive got a piccy viewer running in the background with about 30 pictures on screen in 256 colour, Fiffi is busy doing some troughing and CAB is telling me there's not a lot of Atari based sites left :-(

> do you use your machine for web surfing?

Sure do.

>how does it compare to a falcon?

For day to day use it gives that old rooster a real good kicking, obviously DSP applications cannot be entertained on my Mega, it also gives an upgraded Falcon a real good seeing to in most cases.

I'm not going to part with mine. In fact i'm contemplating fitting it in
a tower case as soon as i get to audition one. :-)

Only a dedicated idiot like myself would spend the neccesary amount of
money to do a setup to this level.
In fact i dont know anyone who bought their kit new, there are lots of
second hand PAK users around.

Pop along to here for more information, and carefull you dont drool on
the keyboard, could cause a fire. :-)

Unless the design changed, they were made for the "normal" STs and
owners of STEs had to buy and adaptor. Although the CPUs in the STE
and ST are the same make and model, they are different sizes, STE has
a square type chip (PLCC) and the ST(fm) has a long rectangular chip

(DIP).

At the moment I'm searching for a Tower case for my Falcon. Problem is in my Towered ST the mobo is too long, and blocks the three lower 5.25" drive bays, only giving 2 left :(

I don't want to make this mistake again, especially now I have SCSI (SCSI=more drives) so I'm looking for a wide Full Tower (more than 8") so the mobo can go to the side of the bay hanger (as opposed to being at the back). Proving quite difficult, might have a word with Jo Even about this.

BTW Consider getting the bus accelerator, to make the PAK really fast! Quite cheap IIRC.

Hi Lance

> i take it the 68030 upgrade will only work on STE'S, not a stock
>520,1040, or mega's.

Nope, they will work on all Atari 68000 based machine, but the MegaSTE requires an additional board to correct timing problems with the mother board and if i read the book right allows the MB to be clocked at 12Mhz.

>if so is it because of the better tos, and color palette?, or hardware
>architecture?

Nope, but one of the features of the PAK is that you can add a different processor, such as a 68020 or a 68030.

You can also elect a different TOS if you choose, and a special modified 32 bit TOS is available for the 68030.

Hi Derryck

>A PC shop should help.

Hello Mr. PC world rep, i need a floppy drive for my Atari ST.

Certainly sir, and what version of windows is your machine running.
Our current selection of floppy drives require Windows 2000 for some of
the newer features, this i can bundle with your floppy drive for only an
additional �85.
There are so many updates and features added to this version that would
benefit and enhance your system that you'd be a fool not to take this
offer..

I've been looking for such a tower myself, but they're hard to find. One way to work around this is to use a normal miditower, mount the mobo on the outside of the frame and replace the original cover with a wider one. Without the proper tools it's not easy to make a good-looking metal cover though, so you might want to use fiberglass or even wood for this.

Hi I'm emulating my old Atari on my PC :(via TosBox 1.10

I can get NVDI 3.0 to run, but it only deals with the fonts and not the screen resolutions. I can get it to run at 1280 x 1024 in 16 colours but not the higher colours 256 etc that my TT used to have.

NVDI is configered for my old ET400 card, my PC has an STB Velocity.

Any ideas?

tia

>0k/2M, 2M/2M. So a 2.5 meg upgrade add's 2meg not 1.5meg.

Only partly correct. There was an article in /ST Computer/ many years
ago that allowed you to use 3 MB in a STFM 1040. I translated it into
English. It needs a small circuit added and minor board mods to use the
extra 1/2 Meg. I actually bought the parts for my uprated 520 STFM but
never went ahead as memory prices dropped enough to make it worth while
disabling the whole original 1 MB of memory and go straight to 4 MB of
SIMMs. (Though the 520 STFM only had 1/2 Meg as standard, when I bought
mine Evesham soldered in a second 1/2 Meg bank to the available pads.)

Regards, /Peter/

Hmmm, I would be interested in a look at those schematic's. Where are they
avaliable? I have never heard of a 3MB ST, it would be an interesting
project;-)

I always had the impression you did this to your Falcon. Anyway, the widest I could find was the A500 which is 220mm wide, but just too short by about 60mm or somewhere around that figure. The Q500 is about the widest at 200mm that is a full tower. I mean I could buy one of those big fat server cases but at $400 a piece I don't think so! There were some I was looking at for over $1000. Extremly nice and extremely pricy. :(

I'm actually going to use a full tower and just put up with having the last drive bay not usable. I suppose it could be used for a shorter device. I've realised, that if I get a full tower exactly the same as my ST's one, and move the mobo back 30mm and down 5mm then I'll be able to utilise all but one of the drive bays. Right angle midi plugs are (will) be used and the usual bending up of the cartridge port for dongles.

Oh, yeah, I forget to tell you something.  The PAK needs to be in a
bigger case :(  Instability is fine, although I think some machines
didn't like 50Mhz clock.  Software incompatibilities is no problem if
you're using modern apps.  Remeber you can switch back to the original
state with the good old 68000.

No, I have a normal maxitower (six 5.25" slots) where I cut away parts of the two lowest drivebays. They can still be used for 3.5" devices (with modified 5.25" -> 3.5" adapters), but I only have one harddisk, one floppy and one CD-ROM so I really don't need that ;-)

Isn't TOS open source? Or is that just GEM? And where are these Falcon Tos
version's located? I have been after a binary of 4.04 for ages.

Probably because it's a bit specific to the TT and as far as I
know, emulators generally do not support it.

Exactly what I did, I used the half cut 5.25 bay to fit another scsi hard
drive. I got 1Hdd, 1 removable Hdd, 1 syquest 5.25, 1 cdrom and a floppy
into my Full tower. I had to mount the psu sideways tho to get the falcon
board in.

For the PSU I made a new face plate on the back where the PSU was
originally, cut some IEC slots for it and hung the PSU right at the
top, across the frame useing some mild steel. Then just made some
simple small mains extension cables.

There are online dictionaries, try Bablefish or Systran.

You could also try Mark Wherry's GEMTrade, which will plug into CAB's
Modules list and provide translation of web pages.

Never, ever mention Atari in a PC shop because they'll suddenly become deaf, dumb and blind.

Sorry but I can't tell you where it was, cause I just don't have the URL. But I found falcon tos once.

Kylo :-)

There has been much debate recently about the planned new computers from Medusa and Milan.

Has anyone here every tried to "home" build an Atari compatible machine ? I don't mean self assembling a Milan or Hades but designing the whole thing from scratch. Obviously, the PCB would need to be done commercially so it would only make sense if someone wanted something a bit special. Maybe the surface mount soldering would defeat even the most patient person.

It is well beyond my abilities I must confess but I know that many things get built by people who have access to modern PCB design tools and a good electronics workshop were a lot of proto-typing goes on.

Does anyone know what, if anything, is currently happening at Milan ? I assume that they are quietly working away in Kiel building the super-Milan that they announced three months ago. It is possible that they have a proto-type sitting on a bench being tested but we have heard nothing and I need reassuring.

Peter

You need a licence to supply TOS roms? I think not.

Do you realise what a prat you look continually sniping at an Atari Supplier
established eight years ago?

All the musicians I work for must be ankle deep by now.

Just what do you do that's constructive? Besides sell the occasional mouse,
we all wanna know, don't we????

                      Regards from STEve & his nice warm tea cosey.

Yes, Sweetie, I think we all know what you've got by now........

I won't mention my two TTs, TTM 195 monitors, Clab Falcon, Mega STE,
16mhz TOS 2.06 Mega ST and SM 146 monitors again, promise.

Anyone else wanna have a go at Keychange Music, feel free.

Just try to be honest and constructive.   Lies = libel

Barrie at Keychange Music Services.

SOME THINGS just NEVER CHANGE....................................

I have been following the Atari groups for a while now and even though i am no longer active in developing Atari related products i still spend time talking to old customers and reading about new products on the Web.

Back in the days of Compo, Gasteiner, System Solutions, Marpet, Ladbrokes etc etc etc, the market was competitive and at times saturated by the bigger dealers and their large advertising budgets. As soon as the market began to shrink (mid 96) many dealers had either gone bust trying to support the platform or had jumped ship and told prospective customers to basically go away. However, some dealers where still entheuastic about the platform and carried on to support it with spare parts, software and repairs.

As suppliers we all had to endure the customer who is never pleased. Sometimes it was the suppliers fault and other times it was the customer who was being unrealistic or down right rude and abusive. Many stories about various suppliers did the rounds but as ever there is two sides to a story and most of us did not dignify the rumour with a responce (enough said).

What i cannot understand and hence the reason for my posting is the stupendous rantings of a user called "Steve Sweet". His postings are offensive and the content at times (comp.sys.atari.st) is down right disgusting for a group that is meant to share information about the Atari and not about a certain act. Steve Sweet in my opinion is the type of person who likes to voice his views without any thought and is probably the customer from hell. If Steve Sweet is such an authority on the Atari then maybe he would like to tell us what he ever did for the platform except winge and be a wanabee rep for a certain company. (Whats wrong, are you still trying to get a (h***) job their)

At the end of the day the companies left in the Atari market are few and far between. Many people are happy to have their machines repaired or serviced at reasonable rates. If someone posts an enquirey for information to an Atari group then as long as the responce is reasonable then anyone can respond wether it be a dealer or private person.

Good luck to all the Atari Users Around the world

Dave Escott
(TUS)

(By the way the spell check ain't working so sorry for the bad spelling)

Hey everybody........

You look like the guys to ask for help.....I recently got hold of an Atari
Mega
ST 2......

It has got something which was described as a "PC emulator card", which has
a
"Siemens-made" Intel 286 CPU on it........What software can I use to get
into the
```

"PC" mode ????? Is it downloadable from anywhere ?????

I also heard that I may be able to put a hard disc inside, I have loads
available,
would I be able to do it myself ???? Would I use a SCSI, IDE, or Laptop HDD
???

The Mega ST2 also has a modem interface, I also heard something about a
TCP/IP
stack program for the ST, where can I get it, and how do I get it all
runnning ???? Will
I be able to get on the internet with my ST ??????

If you can help me with these questions, please send me an email......I will
give u my
friendship for life, and all the programs for ST I have.......I also have
loads of PC hardware,
software and other older computer gear which I am going to not want for
ever......

Please help me !!!!

Cheers

Matt Shaw

I echo that sentiment and agree with all you say.Now is not the time for ATARIANS to snipe at each other,we need all the services we can get. I have been perfectly satisfied with those I use and will obviously use them until events change. Both TUS and KEYCHANGE have never let me down.

Nice to know you are still around Dave. Hope you have got over the car shunt.

Regards
Derek

>(By the way the spell check ain't working so sorry for the bad spelling)

The way they accept spelling mistakes in Schools these days will bring a new type of spell check,or maybe we will wind up like our American Cousins and forget how to speak the Queens English.

It can be done - the first 10 Milan boards (that went to early software developers) are completely hand-soldered - I did one myself, and it took something short of one day for the soldering.

Soldering PQFP parts with 0.5mm pitch is no real fun, but it can be done without much problems with steady hands and a normal, temperature-controlled soldering iron and extra flux.

However, many newer parts can only be had in BGA packages, and these are definitely not hand-solderable without a special BGA soldering station.

>Does anyone know what, if anything, is currently happening at
>Milan ? I assume that they are quietly working away in Kiel

The Milan II is stopped, so no new *hardware* is being designed.

Yes you can get different versions of the 6301. The 6301 is an MCU, basicly a slightly modified 6801 MCU. The MCU is a CPU with on chip ROM, RAM, ACIA, TIMERS, and i/o lines. The 6301/6801 have several modes of operation. The application of the 6301 in the Atari keyboard is in single chip mode. This uses Atari's code in the On-Chip ROM to do all keyboard, mouse, and joystick operations, which is then sent to the ACIA '6850' on Atari main CPU board and processed through the MFP '68901'.

Any 6301 can be used in any circuit ONLY if you do not plan to use the device in any mode which uses the On-Chip ROM. I use the 6301 in some of my projects in Mode 2 which does not use the On-Chip ROM and allows the MCU to access 65280 '$FF00' bytes of external ROM, RAM, whatever. This is the same mode supported by the 6303/6803.

Does anyone have a *.BIN file and a disassembly of the code in the Atari keyboard controller '6301'?. I have a ceramic 6301 with a 28 pin EPROM socket built in the top of the MCU. I have tested this IC in an application for a 6303 an it works.

You may find http://www.mctavish.co.uk/archive/st-kbd.tar.gz useful, as long as you have a working ST available.

(If your browser doesn't deal well with that URL, try:
http://www.mctavish.plus.com/mctavish/archive/st-kbd.tar.gz)

This contains some code I wrote many years ago to dump the `ikbd' co-processor's ROM to a file, plus a 6[83]01 disassembler to go with it.

There's even a partially commented disassembly there, from when I had *way* too much time on my hands. ;-)

Cheers, Steve

>unrealistic or down right rude and abusive.

I personally have found that some suppliers have been absolutely disgraceful in the "service" or lack of it they have given (not Sys Sol's or yourself btw) and have heard many stories too from very well respected ppl I know who have had similar experiences. So perhaps some of the customers may have had just cause for complaint?

>rantings of a user called "Steve Sweet". His postings are offensive and the

Steve _can_ be blunt at times and I guess he can go ott but I have also found that he is _very_ helpful with advice (normally the first) in certain areas - which some "so called experts" I found seemed to think was only to be kept to themselves - true.

>he ever did for the platform except winge and be a wanabee rep for a
>certain company. (Whats wrong, are you still trying to get a (h***) job
>

I have found that if you do manage to find a good - and still active - Atari supplier you feel obliged to recomend them as you know that your mates won't get ripped off - maybe Steve feels like this too?

>Good luck to all the Atari Users Around the world

Best of Luck to you too Dave and if you get some spare time can you cook up a Ste Veloce+4 compatible colour graphics expander card! :-)

>would I be able to do it myself ???? Would I use a SCSI, IDE, or Laptop HDD

You should be able to install it yourself. A SCSI drive will do nicely.
You will need a hard drive driver program like HDDriver.

Hi there,

I'm trying to install FreeMiNT 1.15.1 onto a Falcon with
14MB RAM, IDE/SCSI disks, and an FPU (also PowerUp2 CPU
accelerator). I plan to use the XaAES 0.9x beta as a GUI.

MiNT doesn't seem to like my machine, as it crashes during
booting. This is what is tells me...

```
Reading 'mint.cnf' ... 7746 bytes done

pid 0(MiNT):MEMORY VIOLATION:type=hardware AA=FFFFFFFF PC=1645C8 BP=16348C
pid 0(MiNT):Operating system killed

FATAL ERROR. You must reboot the system
```

...at which point everything stops...

Obviously something is NOT right here, as evidenced by the text shown, and the fact that the machine hangs (doh!). I've carefully gone through both 'mint.cnf' and 'xaaes.cnf' to check all is OK. It is. I've also played with options in both those, and still it crashes with the above message. NVDI is in the right place, so I've run out of ideas as to the cause of my problem.

Can anyone shed some light on this? Is XaAES the best option? (it IS a beta!) If not is there a better GUI I can use?

I would really appreciate some help on this one, as SingleTOS drives me nuts (Its ugly, slow, and...well, single!).

Please email direct, rather than news post (I don't read news often)...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

The software would have been supplied with the emulator board, Matthew will have to try and identify the make of the card for starters. There must be at least a manufacturer's name screened onto the PCB, top or bottom.

Hi "Honest" Barry

>> Or there's System Solutions. Licensed to supply any TOS version.

Your system seemed to have added some '*'s, which ive corrected for you.

>You need a licence to supply TOS roms? I think not.

Yes you do, obviously done your homework eh!.

>Do you realise what a prat you look continually sniping at an Atari
>Supplier established eight years ago?

Hm!, it seems only you think so.

>All the musicians I work for must be ankle deep by now.

They do tend to die young dont they muso's, must be the stress.

>Just what do you do that's constructive? Besides sell the occasional
>mouse, we all wanna know, don't we????

All that know me know me!!.

>Yes, Sweetie, I think we all know what you've got by now........

Ooh!, a personal insult, hasnt the tone lowered some.

>Anyone else wanna have a go at Keychange Music, feel free.

Actually its being done in closed groups at the moment, but i know they read in here, perhaps they'd pop in after theyve left your customer services dept.

>Just try to be honest and constructive.   Lies = libel

Hm!, algebra, if Lies = Libel, then truth must equal, upset customers.

Please quote all lies ive told so far, in public so that i may be humiliated, and not by personal eMail as youve resorted to so far, BTW, say hello to Dennis the pimp for me..

I have stated that a number of people are unhappy with past dealings with your establishment and are letting their feelings known, just not in here where you can see it, yet, although if they did i could keep quiet.

>icon's as the ROM, but has a few more too.

I never had that, i made my own at the beginning, but i see someone else
has offered to supply it for you. I think you'd be better constructing
your own, much more personal.

> Hi "Honest" Barry

That's Barrie, which I've corrected.

Any one with a genuine complaint about Keychange can contact me to discuss it.

I've never knowingly dealt with Sweetie, he is publishing claims he cannot at this time substantiate.

I emailed him privately to give him a chance to retract his foolishness with a smidgeon of credibility.

He seems unwilling or unable to do this.

Now I ask him to forward his home address so my solicitor can discuss his claims and defamation.

Barrie at Keychange.

Hello all,

I just got a 20 MB SupraDrive with no software or documentation.
What software is needed to access this drive and where can I get it?
It has one cable about 2 feet long with a 19 pin connector. On the back
it has one 19 pin female and one 25 pin female connector. I assume that
the 19 pin female would be for adding another drive. Is the 25 pin another
printer port? Thanks a lot.

Ralph

Where? When? Basically, Steve is saying that he knows of friends/ other Atari users who have had increadibly bad "service" from you - that's all.

>I emailed him privately to give him a chance to retract his foolishness with
>a smidgeon of credibility.
>

Hmmm, In a credibilty rating I would not fancy your chances with Steve in my books.

>He seems unwilling or unable to do this.
>

Maybe he feels he has just cause then?

>Now I ask him to forward his home address so my solicitor can discuss his
>claims and defamation.
>

I think Steve is on totally solid ground here and if he requires written/ personal backup I will be glad to supply it. Obviously your solicitor must not be on a "no win no fee" agreement or you wouldn't have stated the above.

Ok, as you seem keen on trying to intimidate ppl in here, and you obviously feel _that_ confident then I will put my personal experience of any dealings with you regarding your "service", in writing if necessary, for Steve, (solicitors etc.) or whomever would like to read and discuss it or take any action if they see fit. Beware, as I have witnesses to confirm my details of transactions with yourself and I know respected real "Atari" people who have mentioned other stories - but obviously I will let them comment on their own experiences. I have not mentioned anything in this newsgroup as I was under the false impression it may just have been a "one off" but it seems obvious this is _not_ the case.

Of course, if you would like me to take the time to catalogue my experiences here in this group - no problem. The fact that this is an Atari newsgroup means that users are encouraged to give their views and "support" (the concept of which you may not totally understand) and that also means if ppl are not receiving a good service then they are entitled to give their view (with all the resulting legal issues withstanding). I personally have had more than my fill of any dealings with yourself to even enter into any extended dialogue - but seeing as you are trying to push ppl around in here I have gone against my normal taste to offer my support to Mr Sweet.

If you keep records, your solicitor will know my full name and address.

- --
Yours Sincerley
Sean

> If not is there a better GUI I can use?
>

Once XaAES is finished, it will be the best. ;-)
Before that, you can use N.AES which is commercial, or Genevea.

XaAES IS beta indeed. This means there is absolutely no guarantee.
Back up your data before using it. You must rename mint to mintnp because
XaAES is not yet ready for memory protection.

Follow Frank Naumann's advice and use the latest stable version of mint.
XaAES is released as beta for betatesting. So I expect bug reports from you.
(This sounds better than 'complaints' :-)

> I would really appreciate some help on this one, as SingleTOS drives me nuts

No, you ask to the NG, then replies go to the NG, so others can benefit from them.

Hi Chris

This isn't a problem with the ramdisk is it? From 1.15.0 and onwards,
one needs a newer ramdisk, FNRAM.XFS 0.70 or newer, IIRC.

Hi Derek,
Nice to hear from you again. The Car Shunt you
mentioned turned my car from a saloon into a compact and
hence an insurance cheque. Iv'e got another Rover now
(buy British) and it's great.
Thank you for your support in replying to this group, sorry
for the rather long rant the other day but i wanted to vent
some of the frustration that built up whilst running TUS. The
truth of the matter is that no matter what you do for certain
people you cannot please everyone.
Take for example Veloce +2/4 for the STE. That was a sod
of a board to write the logic devices for as the timing of the
DMA on the STE was so bad. It took around 6 re-writes
of the state machines to get it right, but, at the end of the
day it wasn't released untill it was a stable product unlike
many others sold by various suppliers. Having said that, didn't
i take some stick for the late delivery and a relativly small price
increase to cover some of the cost.
The stories i could tell to the group about certain products and
the way they were marketed would really annoy a lot of the
regular group members. At the end of the day their is no
point as that is in the past and the future of the group and the
platform is to look to the future.
A message to certain group members is to enjoy the group
and stop the offensive postings. You are part of a community
that enjoys using their machines for the shear hell of it and not
tied to the M$ bandwagon.

As ever good luck to all Atarians around the world.

Dave
(TUS)

PS. I know, another long post without a spell checker.

That's the point, he says he knows of them but cannot at this time prove
it. If he can, let him.

> >I emailed him privately to give him a chance to retract his foolishness
with

> >
> Maybe he feels he has just cause then?

What possible cause can a person who has never dealt with me have to publish
the rubbish he has?
Except that having started this 'discussion' he can't afford to lose

face......can he?

> >Now I ask him to forward his home address so my solicitor can discuss his
> >claims and defamation.
> >
> I think Steve is on totally solid ground here and if he requires written/

Publish the TRUTH and be damned, sir, I fear it not.

Beware, as I have witnesses to confirm my details
> of transactions with yourself and I know respected real "Atari" people who
> have mentioned other stories

Now who's trying intimidation, (it's not working).

> - but obviously I will let them comment on their own experiences.

I hope they do....

>I have not mentioned anything in this newsgroup as I was
> under the false impression it may just have been a "one off" but it seems

> Of course, if you would like me to take the time to catalogue my
experiences
> here in this group - no problem.

This I presume is about the complete hard drive system you bought from me in
perfect working order and returned completely screwed up and which I
repaired for free.You paid the carriage only.
You then bought an additional drive from Sys Sol and messed my drive up
again, at which point I bought my drive back and advised you to use Sys Sol
in future.
I recall you then complained because my drive had been less
expensive.........

As has been said, some things never change.

>The fact that this is an Atari newsgroup
> means that users are encouraged to give their views and "support" (the
> concept of which you may not totally understand)

Ah, the personal insult, last resort of a person who can't get their own way!!!!!!
Don't forget to stamp your foot and skweem and skweem etc.

> and that also means if ppl are not receiving a good service then they are
entitled to give their view

Exactly, their view, not the unsubstantiated ramblings of an apparent users' champion.

> (with all the resulting legal issues withstanding). I personally have had
> more than my fill of any dealings with yourself to even enter into any
> extended dialogue - but seeing as you are trying to push ppl around in
here
> I have gone against my normal taste to offer my support to Mr Sweet.

I repeat, again, deliberately, anyone with an honest, verifiable complaint about my service is free to publish it here or anywhere else. It would be advisable if the complaint was emailed to me first to verify you really are complaining about me, but please yourselves.
Please don't bother to complain about my not telling you how to use a pirate copy of Cubase.

OK then steve,

If your such an authority over what is right and wrong
then please tell me who was only licenced in 95 to supply
Tos 2.06 roms in the UK, aswell as the the manuall.
(Tos 2.06 users have a look for the copyright info in
the manuall that was supplied with the kits). In 95
the manuall was supplied with the roms only on official
licenced product.
Anyone can supply Tos Roms, you do not need a
license to sell pre-programmed parts. Before posting
again check your facts. Some people may one day
even thank you for it.

Dave Escott.

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK
Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe,
and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

I would get HDDriver. It is the best hard drive driver software for the
Atari line of computers. You can download a demo at:

^^^^^^^^^^^^^^^^^^

Ermm, your memory must have eluded you and now that you are trying to blame me I think I should remind you of the facts. I had to send this drive back 5 times altogether and had it - replaced twice - because it just stopped spinning altogether. After the final time it just died again and is now binned.

As you also may remember I sent it back to be tested with the Link 97 adapter I bought at the same time so you could test it together in case of a fault - it never arrived back as you decided to sell it and send me a cheque for 30ukp! all without permission I may add. I suppose I had agreed to this? it would have cost me 70ukp plus to replace! This was the last time I had any dealings with you and wrote it off to not using my normal suppliers.

>repaired for free.You paid the carriage only.

5 x carridge! I could have bought another drive for the amount it cost.

>You then bought an additional drive from Sys Sol and messed my drive up
>again,

Yes I did buy another hard drive from System Solutions which amazingly actually worked! which your drive did, intermitantly, for about a week then died again.

> at which point I bought my drive back and advised you to use Sys Sol
>in future.

At which point you starting moaning that I had the cheek to use another supplier and in a strop (skweem and skweem etc) said send the thing back, which I did and on having to contact you for a response after sending it you then decided that you would _not_ now send a refund and would only replace the dead drive again. You did and it died 2 weeks later.

This you explained was because you were "upset" cause I had mentioned System Solutions! to which I explained that I could use whomever I liked.

>I recall you then complained because my drive had been less
>expensive.........
>

????? I just don't understand the logic behind this. I initially chose to use you because you were on the surface a lot cheaper than Sys Sol. Obviously it turned out the opposite in the long run.

>Ah, the personal insult, last resort of a person who can't get their own
>way!!!!!!
>Don't forget to stamp your foot and skweem and skweem etc.
>
:)) No, just that I recal when I tried to use your drive as the second drive
- not the boot - to see if we could then find the fault, I found I couldn't
because the drive id jumpers were not wired up and to be told that it wasn't
up to me to choose how I should setup my system! I think the "skweem" thing
is something that you have based you PR on ;-)

>Exactly, their view, not the unsubstantiated ramblings of an apparent users'
>champion.
>
But as far as I can read (unless I've missed some postings in this thread)
Steve hasn't critisized your company on here - so why the big fuss?

All I can say that in my personal experience, and I have used most of the
Atari companies still in buisness I personally would never deal with you or
recomend anyone to again. But, Derreck Hunt feels the opposite so it seems
that not everyone has had the treatment I received.

As Dave says it's a shame that we have ppl sniping at the few dealers that
are left but it's also a shame that those dealers can treat their customers
with contempt and get away with it too.

I personally have nothing to gain for critising you as I know that I am
not interested in using Keychange again or want any compenstaion or the like.
As far as I'm concerned I've put it down to a bad experience but would hate
to see anyone I know go through the same thing.

I spend too much time editing icon's on my Falcon's. Anyway Ron Field has
e-mailed my a copy, thanks ron. Like to keep the Mega virgin, the only mod I
nave done to it is replacing Tos 2.05 with 2.06. Altho I am keen to get an
ICD internal scsi controller one day....

Mark

I have a 4 meg Stacy with a 40 meg Conner Hard drive. There is one thing I find annoying about this otherwise cool little computer. The hard drive goes into sleep mode after about 10 minutes. It takes a few seconds for it to "wake up" when I have to save or load something, which can be frustrating if I need to load something fast especially when I am using it for performing sequences (I am a musician and use it on stage). One other thing is if an application is working and needs to access the disk and the drive has just gone asleep the computer gives the dreaded "Hard drive C may be damaged" message and I have to reboot.
Is there a way to set the sleep mode for say 60 minutes or longer or to turn it off altogether?

Hi Barrie,
I kept this old message for reference and I'm interested.

Tell me, are these original TT keyboards or is it an acceptable alternative you've developed? Are there any wierdo key reassignments I need to make?

The reason is that I've typed so much that I've literally rubbed the printing off my keyboard and I occasionally have a problem with keys not registering as pressed. I know this is nothing drastic, but I've screwed up a keyboard more than once and I'd appreciate something pristine.

regards
Harry

These are brand new TT or Mega STE keyboards in various languages. They 'adopt' the TOS language of the machine, most of the keystops can be switched to give an English layout.

Barrie at Keychange.

Each time you managed to screw it up, it tested ok here after I fettled it.
I have no control over what you do to hard drives.

> As you also may remember I sent it back to be tested with the Link 97
> adapter I bought at the same time so you could test it together in case
> of a fault - it never arrived back as you decided to sell it ....

Wrong, I bought it back as you seemed to think Sys Sol were a better place
to deal with.

>it would have cost me 70ukp plus to replace!

Some things never change, you screwed a good deal and then whinged.

>This was the   last time I had any dealings with you and wrote it off to
not using my
> normal suppliers.

If the deal was so bad why didn't you complain to Trading Standards.

>You paid the carriage only 5 x carridge!
>I could have bought another drive for the amount it cost.

If YOU keep screwing something up I ain't paying for it.

> >You then bought an additional drive from Sys Sol and messed my drive up
> >again,
> Yes I did buy another hard drive from System Solutions which amazingly
> actually worked! (I should hope so) which your drive did

Yes, mine did work perfectly until you got your clumsy mits on it.
>
> At which point you starting moaning that I had the cheek to use another
> supplier

Actually I was annoyed you were holding them up as a paragon whilst blaming me for your own incompetant meddling.

There comes a time when there is no choice but to leave a fool to his fate.

>I explained that I could use whomever I liked.

That's whosoever and yes, you can use whosoever you wish as long as it ain't me.

> >I recall you then complained because my drive had been less
> >expensive.........

> ????? I just don't understand the logic behind this.

Just like you didn't understand hard drives.

> I initially chose to use you because you were on the surface less
expensive than Sys Sol.
>Obviously it turned out the opposite in the long run.

Due to your incompetant meddling.

>.......I was told that it wasn't up to me to choose how I should setup my
system!

As with all my customers I discussed the set up with you and supplied the drive to your spec.

> >Exactly, their view, not the unsubstantiated ramblings of an apparent
users'
> >champion. But as far as I can read (unless I've missed some postings in
this thread)
Yes.
> Steve hasn't critisized your company on here - so why the big fuss?

Sweetie has stated he knows of people who say I give a poor service and defamed me.
Again, if people wish to complain, Trading Standards are the people to whinge to.

> All I can say that in my personal experience, and I have used most of the
> Atari companies still in buisness I personally would never deal with you

Hooray!!!! This is rich from someone so clearly the author of his own misfortune!!!!

I don't see any more complaints on this newsgroup yet, do the disgruntled customers really exist or are they a figment of Sweeties' imagination.

Barrie at Keychange.

Plug them in, and just use them. I have several drives now which have
always worked great no problems. In fact, I _was_ initially under the
impression that hard drives didn't "ever" work properly until I bought
one from someone else.

Link97
>Wrong, I bought it back as you seemed to think Sys Sol were a better place
>to deal with.
>
Ha! well there you go again, to buy something back you have to have
the owners permission - but that obviously doesn't mean anything to
you. Typical of you loose scandalous attitude towards customers.

>Some things never change, you screwed a good deal and then whinged.
>
You don't actually understand do you? If someone doesn't want to sell
something they shouldn't *have* to.

>If the deal was so bad why didn't you complain to Trading Standards.

```
>
Because by that time (or more acurately long before) I had become
totally sick of dealing with you - phone calls etc - that I decided to
cal it a day. The costs involved in phone calls, carridge etc were
becomming ridiculas, but then that's probably how you do buisness..

>If  YOU  keep screwing something up I ain't paying for it.
>
I agree, but when it "dies" or doesn't function correctly from the
onset and when compared to something that did - who's the problem?

>Yes, mine did work perfectly until you got your clumsy  mits on it.
>>
Until I opened the box...

>Actually I was annoyed you were holding them up as a paragon whilst blaming
>me for your own incompetant meddling.
>
:)) and then after I sent the package back (again) as you agreed for
a full refund, you decided to change your agreement...very professional
attitude which I hope prospective purchasers are taking note off...

>That's whosoever and yes, you can use whosoever you wish as long as it ain't
>me.
>
:-) I think you'll find *I* did that because I binned the (again) non
working drive and called it a day after you had sent it back - but
I had gotten used to that by now.

>Just like you didn't understand hard drives.
>
:)) yeah, like you don't understand the meaning of good service or indeed
selling one that actually works!
Like I said, strangely, I have build up my own drives since and even
though I would admit to not being Uwe Seimet, I can get by with little
help these days - and with no help from the likes of you I might add.

>> I initially chose to  use you because you were on the surface less
>expensive than Sys Sol.
>>Obviously  it turned out the opposite in the long run.
>
>Due to your incompetant meddling.
>
No, Due to your incompetant fettling...

>As with all my customers I discussed the set up with you and supplied the
>drive to your spec.
>
Rubbish! You just forgot (or couldn't be bothered) to fit the jumpers.
I was just a system and that's it - but that's no problem. The problem
comes when I want to upgrade or increase my setup, So even if the case
has the option to change id's you dictate that I can't? Obviously I can
do that on my own now but as this thing of yours was under warranty I had to
```

```
send it back. Again, very unprofessional.

>Sweetie has stated he knows of people who say I give a poor service and
>defamed me.
>Again, if people wish to complain, Trading Standards are the people to
>whinge to.
>
>> All I can say that in my personal experience, and I have used most of the
>> Atari companies still in buisness I personally would never deal with you
>
>Hooray!!!! This is rich from someone so clearly the author of his own
>misfortune!!!!
>
Hmmm, well I seem to be doing ok now I don't have to put up with using
your equipment. In fact I sometimes do beta testing for a few ppl and have had
no complaints so far, so maybe it was *your* involvement that was holding
me back? Anyway, I think *you* are doing the best advert ever for
detering users away from your "service" anyway, keep up the good work!

>I don't see any more complaints on this newsgroup yet, do the  disgruntled
>customers really exist or are they a figment of Sweeties' imagination.
>
No, I'm one but as per all your previously poorly treated clients I
guess your attitude has said it all really.

Best of luck, you will need it...

Hi,

I was wondering if anybody could tell me how big a Deskicon.RSC file can be.

I only ask because I can make one that uses a lot of new icons and takes up
about 500Kb and during booting, I get an out of memory error.

I am using a TOS 4.04 Falcon with a 3.2gb hard disc and 14Mb of Ram.

Tim

hi all,
i have a friend with a 1040 ST that has 2.5 megs in it, i think its the
EZ RAM 2.5 meg upgrade. not being the installer, or not ever having done
a upgrade on a ST, if it is a true 2.5 meg upgrade does it include the
original meg as part of the 2.5, or is it really just adding 1.5 meg to
the system. if it a true 2.5 megs added, what happens to the original
meg? how can this be accessed. according to his diagnostic software his
machins responds as 2.5 megs of free ram.
thanks,
lance

Well it depends on your RAM. I have 135meg in my Hades and Jinnie uses RSC
files totaling almost 3meg.

Forget that, you'd be tearing your hair
out at the transfer rate. Get a SCSI card
for the Milan.

> machins responds as 2.5 megs of free ram.

Here's how it works: you have 2 bank's of ram in an ST (FM or E). They are
either half a meg or 2 meg each. so to get 2.5 meg you dissable half a meg
and increase a bank to 2 meg. So that would mean, being a 1040, that one

onboard bank is off. In theory, depending on the upgrade, you just dissable the other half meg bank and install another 2 mb of dram. STe's use simm's and wont support 2.5 mb. Here are the permutation's, 512k/0k=512k or 520ST ,512k/512k=1M(1040ST) these are the Atari Standard's. Then you can 2M/0k, 0k/2M, 2M/2M. So a 2.5 meg upgrade add's 2meg not 1.5meg.

HI Shiuming,

I would love to. It difficult getting a card with the correct chip set in the
UK, impossible to get the driver. If you know different, please let me know.

Bob King.

On systems running MagiC it's usual to have input fields which scroll to
reveal any remaining text that's too long to fit into the window BTW :-)

>Whats that got to do with anything. :-)

Hmm, well I'm usually the first to complain when OT stuff creeps in!

So, I could use Scooter to design the PCB on my Falcon (phew, managed
it!) :-)

Apologies to Lyndon for mistakenly sending him an email on this
subject, it was meant to go in here but I hit the wrong button! :-)

Very easy, you need to unsolder the ends of some resistors and connect them to
+5V to disable the existing memory banks.

Having soldered in loads of memory chips myself, I'd definitely recommend one of
the commercial memory upgrade boards, much easier to expand to the max 4Mb.

THere's a lot of us out here who would love to get an ATW.......I missed a chance at one that had about 16 transputers in it a few years ago (I didn't know what it was back then) and have been kicking myself for it.....

Hello,

Does anyone know any technical details about the AplleTalk connector
available in Megas and TTs? How does it compare to UTP? Has anybody
utilised the connector?

Kylo :-)

PS. So many questions at the very beginning of the century... ;-)

Port is an serial port, nothing more. "LAN" suggest Network, but it is
on atari only an name for an serial port. No adaptor avaiable to connect
an atari via "LAN" and UTP cable to an local network.

Regards, Robert

Should work, provided it fits in mechanically.

cu

Is there any page on the web listing all available HD drivers ?
I could try them all and see if one manages to work around the problem.
The only drivers I had tried was the ICD 5.x and 6.x.

This really is a hardware problem I think, I would go for an IDE interface,
try;

www.keychange.co.uk

http://gem.win.co.nz/mario/hardware/

Or if you have the extra harddisk, etc then I would get another STE, I got a
1Mb English one for �30 inc P&P and I know people have picked them up for
less (much less).

Maybe you could try the CTT booster from

http://www.czuba-tech.com/

This has a fast EDO controller onboard PLUS you will get a 64Mhz 68030, I
also think this will change to a 68060 in the future but we will see.
Unfortunately it is not ready yet but it should be in the next few months.

Will it? Last I heard it wasn't even worked on, i.e., nothing has been
done on the design or anything.

As always you are of course welcome to prove me wrong...

Best regards
 Sven

Hi everyone!

Do you know where can I download a full version of Atari UNIX system V?
Is Atari system V compatible with TOS?

This is third hand info (so it could be rubbish, and probably is) but the CT60 should be shipping in the next month or two, as soon as that is done then the CTT will be finished. The reason that the 68060 may be used is that the CT60 uses them and all that is needed is an order for a few extra (i.e no large batch problems). The CTT is basically the same ' idea' as the CT2 or the CT60 (I do not know) so the development time should be less.

I think there is about 20 people after the CTT at present (anyone that has not showed their interest really should).

As for my opinion, the more Atari system that we get towards the PPC the better (TOS, Mint, Magic, etc needs to make that jump) - if the cards include a 68060 BUS connector then it should be possible to connect a PPC at a later date, Tempest is forgoing this step and I can't wait for them both to come out!

You should also remember that the Atari community is always held back by delays.

This ColdFire clone coming out is going down a slightly different route but I do not know much about the chip, I think it is just a real quick chip which is based on the 68040 - maybe it is better to use these chips in the upgrades instead of the (relatively) slow and expensive 68060 (I don't know the technicalities of it). I do not think that the ColdFire Clone is going

```
to come about, the poll on Magic finishes in 5 days and only 43 English
(speaking) people have voted, that leaves 300 or so from Germany and about
150 for the rest of Europe and USA required before they will consider
building it - if only there was a good Web browser (Java applets, etc) then
no one would care but at present everyone is maintaining 2 computers
(Win-tel or MAC and a TOS).

I would like to see an ATX PPC MoBo that boots into TOS, Magic, or
whatever - I think most people here can sort the rest out.

Mark

All I really wanted to do was take out some chips that will probably be hiding behind a layer of steel and a couple of inches of air.

The rules say I can't but it would still be a nice experiment, the last one looked good but failed (really disappointing). I thought a Cap full of charge may work?

Another idea I thought of was to put a charged Cap into someone's pocket, how long will a Cap hold its charge? Will this kill someone? (I ask because I don't want to do this as it will not be that funny in a pub)

Mark.

You can't. This is no freeware product. You wouldn't have been able to
install it anyway from other media than a tape drive or a pre-installed
hard disk.

> Is Atari system V compatible with TOS?

No. It's a Unix and thus not compatible with TOS.

I also have an early TT with the CPU daughterboard, and it doesn't
interfere with the fastram-card at all. Atleast both the original 4Mb card
and the aixTT fits with lots of space to spare.

Hi;

Following Jo's experience with accelerating a STacy, I tried to accelerate a Mega ST (up to 10MHz for the moment) and to convince a SM124 monitor to work with it- so far with limited success. I built a little circuit that produces correct sync rates, and made a little program that sets a flag for external syncs into the register at $FF820A. The external sync circuit works perfectly with computer at original 8MHz, but not so good with CPU at 10MHz- the picture zig-zags left-right about 10-20 pixels, several times per second, and there are white specks in the picture, which will require further thought. An unfortunate side-effect is that Lacescan circuit and driver do not work with external syncs at all.

It seems to me that getting a correct picture with extended resolution may be, from this point on, a software, not hardware problem. Is there a screen driver available somewhere for a ST accelerated like this? Or maybe Lacescan/Overscan drivers should be OK but my hardware should be designed differently? Any other suggestions?

Alas, that magazine article on this subject (ST-Computer, 9+10/1992) would be so useful if I could find it...

Btw the sync circuit takes the 500KHz signal (I generate it anyway for the keyboard ACIA) and then uses two counters: divide by 14 to get horizontal sync rate of 35.7KHz (2us sync pulse width) and then by 512 to get vertical sync rate of 69.7Hz (28us sync pulse width) - apparently the slightly lower vertical sync is acceptable (is it really?) to both the computer and monitor,

```
at least at 8MHz CPU clock.

Thanx in advance.

MARTINAUX Franck wrote:

> Ok, so there is no advantage to use this OS instead of  MiNT?

If you are interested in a full-featured Unix, MiNT won't do. I
recommend reading literature on Unix. You don't seem to know the
differences between these systems and that's why you should improve your
knowledge about Unix and MiNT before deciding anything. As far as Unix
is concerned nowadays Linux is definitely a better choice than the Atari
System V. And, of course, you need a faster machine than an Atari to be
able to really work with Unix. The TT is simply to slow for working
seriously in a Unix environment.

Hi all;

The Atari 520ST was created.But then came the Atari 520STfm, which had a
floppy ("f" ?) and TV OUT .. where does the "m" come in to it?

The Atari System V was only sold together with a TT and 19 " b/w screen.
And how did Atari Benelux install the system?
Put a SCSI-harddisk on their System V TT and copied the lot. Then put the harddisk in the customer TT.
They had a script for this.

Please help..

I finally have run out of room on my hard drive.
I've been looking for a new one.. but I forgot What types of hard
drives will work on the TT.

Will a SCSI Ultra 50 pin work?
SCSI 2? Can I use 68 to 50 pin adaptors? ? ?

Thanks,
Rob M

The Notator program for Atari is still one of the best sequencing
packages, and the Mega STE is a fine machine. Trouble is finding parts
and service

sjhgfdjjhsgdf@hgfd.com wrote:

> SCSI 2? Can I use 68 to 50 pin adaptors? ? ?

Not sure about the 68-50 adaptor, but any 50-pin SCSI disk >should<
be OK. There is really only 1 way to find out...

SCSI ultras, SCSI-2's etc...should still work, as the standard does
include backward compat. for older SCSI controllers AFAIK...

My best advice is to make sure you CAN return the disk should the TT's
SCSI controller not like it...most companies/people would understand
I'm sure...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I think I may have an old 520ST that does not work, would that do??? Only thing is that it is an orriginal ST (not STfm or anything) so I think the keybourd design was a bit dofferent as the mouse and joystick are on the side, etc.

Mark.

Yes. But watch for TermPwr!. 68/50 Adaptor had to terminate 8 not used data lines. Use HDDriver.

Regards, Robert

Hello,
I own a falcon with CT2 accellerator and I already use MiNT.
My job is developper/administrator on UNIX system.
I use also use QNX on my personnal PC.
If I follow your advice, there is no interest in using a true UNIX (BSD or System V) on Atari platform.

Hi Anthony

>The Atari 520ST was created.But then came the Atari 520STfm, which had a
>floppy ("f" ?) and TV OUT .. where does the "m" come in to it?

The 'M' is for modulator, the device that generates the signal in a manner that a TV tuner can eat.

The 'm' stands for 'modulator' - which is what turns a video signal into
a TV signal to feed into the antenna/aerial socket of your TV.

I run Linux on a standard TT, a 33 mHz PC, a 300 mHz PC, and a 600 mHz PC, and I disagree in part. If you only want/need to work in a non-X environment then the TT runs fine enough for development or most any other thing in my opinion.

All keyboard controller in the Atati ST series use the HD6301V1P. Later
units made in Korea do not indicate that it is a 6301. You must use the
original 6301 from an Atari keyboard. The 6301 has On-Chip ROM that is
ATARI's own. The -xxx numbers after the Atari part number indicates
different versions of the code in the 6301. The first keyboard
controllers in the original Atari 520ST used a different support TTL
IC, these will not work correctly in the keyboards that followed.

scrisse al povero All :
 b> fm - frequenz modulator

Ho no, "f" is for "floppy", 520ST (I had one) had an external one, STf had
the internal floppy, STfm had internal floppy and TV modulator.

It may also have existed the STm with external floppy and internal TV
modulator, but I think you can find on a faq.

Hi Mark

>Could someone tell me where to find a copy of the standard TOS 2.06
>Deskicon.rsc file.

The 'standard' .rsc file is in ROM. you can create you own, but make sure
to match the order of the ROM copy.

Or there's Atari Workshop, the /only/ Atari Authorised service centre
left in Great Britain. Licensed to supply any TOS version.

Complete music solutions built and supplied to specification.

As frequented by big music names such as Abbey Road Studios, D.Ream, Rolf
Harris.

I am after the file that originally came with TOS 2.06, it uses the same
icon's as the ROM, but has a few more too.

Well I read this at work and got a patch for you for STiK2.
Qdialer v .47 now will store an init string up to 60 characters long. I
don't know why anyone would need one that long, but 20 bytes shouldn't
kill anyone.

     Well to find someone local to you check with Marios web site.  I
can't remember the URL directly, but you should be able to find info on
his Galaxy Video Card/Ethernet Card on most of the big atari news sites.
All the ones that I've seen have links directly to his site.

> a terminal emulator). Any suggestions?

Load up STalker, Connect, or any terminal app that you might use
for call a BBS. Go to the terminal mode type: AT<return>
if you see "Ok" appear then enter the init string followed
by a return, then type:

```
AT&Y0<return>
AT&W0<return>
```

That should store the current settings into the NVRAM and make
it the default at power up. Most modems use these same commands
at least several I've had over the years did.

ATZ or ATZ0 will reset it back your settings, assuming the above
commands worked.

Good luck...

I was thinking about Robot Wars and using some BIG caps to shock the others but on testing the results were very disappointing, plus it would appear it against the rules.

I used a CD-ROM drive and tried to 'burn' some of the chips, etc in it - using a car and one of the HT leads I arced it across the drive but it worked fine after, this should be about 30,000 volts and well I do not know what the uF would be (probably not enough). It may have simply been that the sparks went through the case and did not go near the good stuff.

How long would a BIG cap take to charge on a standard 12V car battery?

(I think I may be going a bit sad in my old age).

Mark.

If you go to some car audio showrooms, you can buy 1 Farad capacitors off the shelf. Only 12 VW or so - but enough to give a nice fat spark when charged and then shorted, I would have thought.

Regards, /Peter/

Yup, that'll do it, Lonny.

It would also be useful to do an AT&V to view the active profile and paste this into a text file. Then do an AT&F to recall the Factory profile (don't do either of Lonny's two above when this the factory setting is on view, otherwise you'll have to start from scratch).

From the results of the active and factory settings you can determine those ones that are the same. If they exist in this 40-character string then they're redundant and can be removed.

Then, just keep a note of what's left, so if ever there's another problem with the modem you can solve it with:

```
AT&F
AT....init string....
AT&Y0
AT&W0
```

This should always work (I think).

Thank you Lonny and Harry. And Dan - thanks very much for modifying QDIALER. I hate to say it, but I've been having other problems trying to get STIK2 to run on my TT with Magic 6/Thing 1.27. Qdialer behaves similar to when I start a AUTO folder program from the desktop - my whole screen begins to scroll upwards, line by line, every five seconds or so as QDIALER updates its current state of connectedness (sic?). So I've been working with STING for now.

Regards,

Ha, same here. About 2 years ago I thought that up but the guy I was
working with downloaded and printed of loads of information including
the rules, and it strictly says "no discharge capacitors or HT coils,
or any other means of producing high voltage" It would have killed
there radio gear and get very annoyed especially when some of the
recievers are over 200 pounds.. :)

>I used a CD-ROM drive and tried to 'burn' some of the chips, etc in it -

uf? I think you mean current. Chips won't burn on 30,000 volt if its
only a few ma which it is. Go down to about 50v, like I do on my
bench PSU, get a sheet of glass for protection, and use some 10v
2700uf caps (quite big) and shove that through em. They blow big
time!

>How long would a BIG cap take to charge on a standard 12V car battery?

You have to make an inverter to charge a 400v cap up from 12v. You
can use lower voltage caps, which have a big advantage that they
through out huge amount of amps!

Hello,

I have a (french) 520STe with the bogus DMA chipset. I'd like to know where
I could find drivers to solve my problems when using a hard drive. I'm using
a SCSI hard drive with a ACSI / SCSI converter.

Thanks.

Fred

No problem at all. It was a simple patch. And as for your other problem it is simple as well. Check in your default.cfg file or your dial script. One of the two has REPORT = 1 in it. Turn it to REPORT = 0. The REPORT variable dtermines whether to print some debugging information to the screen or to supress it.

True, they're designed to give good low end bass, but it would be
interesting to see if they're really 1 Farad, as there is a lot of
fake ratings going on, especially in the car audio area.

I think the only way to patch the DMA problem is to solder a newer one
in.  Anyone else?  If you use IDE on a ST you can get around the DMA
problem.

As this string will be an ascii string, you could use a terminal
emulator, type in the string and follow with an at&w to store it.
Any registers that were modified will now be save in memory.

Hi Mark

>How long would a BIG cap take to charge on a standard 12V car battery?

You know the capacity, and since Q=IT, you can work out the rest.
T by the way is the time it takes to get to 0.707 of Vmax, not full
charge, which in theory will never happen.

Hi Lyndon

>How long would a BIG cap take to charge on a standard 12V car battery?

>You have to make an inverter to charge a 400v cap up from 12v.

Why do you. Just smack it across the battery and presto its charged.

>You can use lower voltage caps, which have a big advantage that they
>through out huge amount of amps!

They only give out what you put in, and even a small cap can give out

```
huge amounts of amps, but for a shorter period.

Have a play with Q=IT and you'l see.

ZyXEL.

I have used the Target 25083 for the Atari (and OS/2 actually), it's
the version with 2 POTS built in, there is a less expencive version
called 25082 with no POTS or voice capabilities.

http://www.targetweb.nl/txt/tx25083.htm

These are for sale all over europe, both under the Target name and
others.
I paid around 100 euros for it (ex tax)and it should be availeble even
cheaper.

A 400v cap being charged with a 12v battery will only be charged upto 12v
surely?

Yeah, but then what's the point of have big amps for short periods!
With a 27,000 cap with 50v in it, it held a screwdriver across the
terminals for about 5 seconds.

Once many years ago, i was trying to install a memory upgrade to my 520stfm, and somehow shorted out the powersupply and 240volts was sent straight through the motherbord. Blew the shit out of the powersupply and i thought the computer would have been dead too.

but its now working happily on an amiga 500 powersuplly bodgily soldered in.

I bet if a pc had the same thing done to it, it'd be cactus.

eventualy i couldnt get the memory upgrade kit to fit, because it was the wrong version... but i got my st up to 1meg by soldering sockets and capacitors equivilent to the bank 0 ones, onto the the bare bank 1 side, just put 4 chips in the sockets from an old pc video card and it worked perfectly...

I think someone is tumbling in the dark here ;o)

Just a few thing I think should be considered.

When you are after biggest bang for a buck, what counts is energy that can be stored in cap, not pure capacity.
W=c(U^2)/2, Where W is stored energy (Ws=J), c is capacity (F) and U is of course voltage across the cap terminals (V).

So, cap from 1040 ST's PSU (100 �F/400V) can store as much energy as 10.000�F cap, rated for 40V.
If you want especially violent burst, it helps to have caps with low resistance and low inductance. That is the key reason why one can see many smaller caps, wired in parallel.

Steve Sweet wrote:

> HI Lyndon
>
> >Hi Steve!
>

> Not yet, working on it though.
>
> >>>I've got 700uf so far...
>

If that 700 �F are high voltage, then you might have something, but REMEMBER:

- always charge cap through appropriate diode and some resistive load (wirewound resistor e.g. 100 Ohm/ 5W or something like that).
You need the diode to get DC, AC would get you BANG at charging time with cancerogenous chemicals spilled all over the place and possible serious eye damage, caused from airborne bits...

- you have to multiply line voltage by SQRT(2)=cca. 1.414 to get peak voltage to which the cap will be filled. If you live in 220V, your peak voltage will be some 310V.
Add to that some safety margin! For 220V power lines, I would use cap with at least 400V rating.

- caps do get old, which affects their capacitance as well as max. allowable voltage...

Regards,

Branko

is there any such network cards in a VME style suitable for the TT? drivers would also be needed.. and do they have UTP sockets? Coax is useless to me..

Also is there a board in existance for the TT to use standard 72pin EDO simms ?
because that would be alot faster than whats in there .. Or even Better 168pin dimms? unlikly because there 64bits each, but i suppose 1 dimm could be seperated into 2 banks, or is this not possible?   Or if it is possible, why havent any of you made the boards yet ? :P :)

cheers.

Cancerogenous?  Oops.  I've blown up about 15 or so small 100uf type
ones.

Hi Lyndon

>>>You have to make an inverter to charge a 400v cap up from 12v.

>>Why do you. Just smack it across the battery and presto its charged.

>A 400v cap being charged with a 12v battery will only be charged upto
>12v surely?

Yes..., and the point it..

Are you wanting to charge this thing to its rated capacity by chance?, in which case you would need an invertor, but thats not what you said, you just wanted to charge it.

Remember capacitors store current so it could still be full at only 12V.

The AixTT handles 72-pin EDO SIMMs as TT-RAM. It can take two of 32Mb
maximum, plus whatever you've got as ST RAM in the old configuration.

Woller Systeme should be able to get you a MagnumTT[1], which is the newer
version of the AixTT which supports up to 2*128MB SIMMs.

To be pedantic .... they store charge (coulombs-or what you will).

It was for a plasma globe, but you really need some gas like Argon for a decent display. Got the right LOPT for the job though (I'm going to have to struggle very hard to get this thread back on topic!) :-)

I think I saw something about using a dead bulb or something.  They
use an inert gas like Argon AFAIK.

[regarding QDialer 0.47 now having a 60 character INIT field...]

DA> No problem at all. It was a simple patch.

Well, when I tried it with my 38 character INIT string, QDialer 0.47
only displayed the first 24 characters. Is this a display problem or
have I done something wrong.

DA> And as for your other problem it
DA> is simple as well. Check in your default.cfg file or your dial script. One
DA> of the two has REPORT = 1 in it. Turn it to REPORT = 0.

That did the trick - easy when you know how... I guess I had been a
little over anxious to, erm, configure things as a result of all the
problems I've been having.

Thanks again,

I suggested ArgoShield TC, its got nitrogen and Oxygen in it should gibe
a nice discharge effect.

     Probably just a clipping issue.  There is no wrapping of lines so
anything longer than the window just gets clipped off in display.

I did that as well to get from 512K to 1MB on my 520STFM back in 1989. It seems that the ones with 4 memory chips can be easily done so, for older boards which requires some memory 16 chips, it's not as easy as to solder the blank slots with the correct memory & capacitors. Somewhere there is a need to cut some traces and place some resistors. It may be the memory bank selector or something like that.

Rgds
William

Hi all,

> Is there anybody who has an Atari ATW for sale?

I'm looking for one and other Ataris as well!

I'm looking for various versions of the 520 and 1040, Megas, Mega STE,
TT, Falcons, Medusas, Hades' and Milans.

I'm looking for these items because I'm designing hardware for Ataris
that needs to be working with all kinds of hardware. Also, I will rather
go for a busted or broken device than a high price...

Best regards
Sven

Wow, you must have an early TT. I have the original 64meg board from the same company, and no where in the docs does it mention that situation. Tried asking the company directly? I mailed once about something, I forget why, but they did reply.

Hi all!

Tried setting up a LAN via nullmodem, with the Milan running Sting as
server. No problem on the TOS side, of course:-), but the Mac....
I can set the port speed to anything on the Milan and it works, but
on the Mac, I can't use anything but 19200. Doe's anuone have a clue
or a hint? Is there anybody else who has done this?

This is a common topic. Without too much fear I can say virutally any TCPIP driver for the atari *if* you are connecting it to the PC and are using the PC for the real net connection.

I have seen no full step by step for the atari for this, but there is a TidBits article for the Mac on how to network a Mac to a PC to use an internet connection on the PC. If you track that down, it should give you all the necessary info for the PC side of things.

Keychange Music, + 44 (0) 1925 266120 can supply new TT and Mega STE keyboards in various languages, Spanish, German and others. They all work in the TOS language of the machine, you can change the key tops if you have a broken one.

In England the price is �25 including post. The rest of the world add postage. If you wish you can buy 5 in a box for �100, sell the ones you don't need and get yours free.

It's also a cheap way to fix a duff mouse port on an ST or Falcon, I can provide adaptors for �7.50 inc post in the UK, plus post the world.

Merry Christmas,

Barrie at Keychange.

I really can't see why not. Advice is to keep the leads as short as
poss to prevent picking up stray noises, but it's very unlikely that
if you had the leads really long that it'll crash the computer, I mean
this is audio circuitry.

Virus!!??  Heh, the only one I have on some of my disks is the
annoying ghost virus.  I didn't know there was a virus that made the
mouse go bezerk.  It could be the solder joints but I would have
thought he would have checked those from the start.

Thank you very much! The Modem 1 option is there now.

It seems a bit obvious now, STinG would not be able to recognise the
serial driver, with out the serial support driver being loaded first <:)

Now I just have to work on re-inserting my hair.

The .plt files are probably from Scooter-PCB, the English version of which I translated and used to distribute (none left, I fear). But a demo version should be available on a web site; this prints existing PCB layouts but doesn't allow you to save (and then print) your own layouts. If you can't find it, send me, say, 4 International Reply Coupons to cover postage and I'll send you the demo version on 2 floppies (or 1 if you can handle HD disks).

It's just possible that the files come from Platon, which used the same .plt extender but a different format. :-(

Great choice, and easy to configure, I do not need the PC or Mac
configuration programs, some AT commands and there you go!

Just a pity that analog calls use the Phone2 line, otherwise it would be a
perfect home phone manger too.

Chapelie.rma.ac.be has it under the electronics section for Ataris.  I
suggest you buy the programme though because it's excellent if you do
electronics and you want to use Ataris.

Certainly did. I attempted to replace the 6301 and two tracks lifted (urk!)
and I now have beautiful (not!) cables joining circuits, as the tracks broke
off.. Also, in my TT Keyboard, there is no socket - hence the soldering - I
actually soldered a socket in for flexibility.

After all that, it now works *worse* than before.. I will spend more time on
it after I get over being annoyed.. :)

Can anyone help me to either get an upgrade or to modify the STING Dialer? My U.S. Robotics seems to need quite a lengthy INIT string to be able to log on successfully to my ISP, and the STING Dialer has a limited number of characters in that field - not enough.

I tried simply modifying the .RSC file so that the appropriate fields would hold more characters, but that did not work once I started the program.

Can anyone help me with recoding the program so that the INIT string can hold at least 40 characters?

Thanks,

I just got a 1040 STe through ebay. I have it opened and see the simms,
but I have no idea how much memory it has in it.
It's been a while since I've used an ST and I can't remember how to get it
to tell me how much ram it has installed. I have a bunch of pc 30 pin 1meg
simms lying around, so I want to bring it to 4megs before I close it up
again.

It's hooked up to a monitor and running. I also have stbasic and gfa
basic. Is there a command I can use to find out?
Also, if I do need to put more memory in, what kind should I look for and
what should I stay away from. The memory that is in there has printed on
it,:   MT 4C1024DJ   -7   9039 made in USA
is has 8 chips with a space for a 9th. I assume from the -7 that it's a
70ns.

Any help would be appreciated,
Thanks
Dan

Hi,

I'm looking to download a copy of The Financer (which I wrote in 1992).

Is there a shareware archive that I can search?

It was also on ST Format's July 1992 cover disk.

I'm in a nostalgic mood. :-)

Many thanks

Kevin Munro

When it left the factory, it would have had 1 MB. (520 = half meg, 1040 = 1 meg)

It may have been altered after that.

You machine must have a multiple of two SIMMs in it - as the 68k processor has a 16-bit bus, and SIMMs are 8 data bits wide.

If there are four SIMMs in the machine, you have either got 1 MB (half+half), 2.5MB (two+half or half+two [I can't recall, but some systems have a hardware limitation on what goes first]) or 4 MB (two+two).

If you only have two SIMMs, then you'll only have 0.5MB or 2MB.

It's been a long time (over 10 years) since I've used BASIC seriously on an ST (I generally use attice C or Devpac assembly language on my TT), so here is how I can recall it. (CHECK YOUR USER/LANGUAGE MANUALS BEFORE TRYING THIS!) BASIC isn't known for its standardisation - so your language may be a bit different.

```
    PRINT FRE(0)
```

will tell you how much free RAM you have available for doing things.

To find out how much the computer OS thinks it has installed:

```
    PRINT PEEKL( &H42E )
```

will fetch the four-byte 32-bit integer which tells you how much much memory TOS has found, and print it on screen.

Your language may prefer LPEEK or something similar instead of PEEKL in the example.

If your version of BASIC doesn't understand hexadecimal notation, the address :"&H42E" is 1070 in decimal.

The following values are common:

524288	0.5 MB
1048576	1 MB
2097152	2 MB
2621440	2.5 MB
4194304	4 MB

To convert to megabytes, using the previous PEEK instruction:

```
    PRINT (PEEK( &H42E ) / 1024) / 1024
```

or

```
    PRINT PEEK( &H42E ) / 1048576
```

Can't help with that, but couldn't you store most of the string
functions in the S registers?

The Atari 1040ST when stock has 1 meg of RAM.

I agree.
If that modem is worth anything it should allow at least one
custom/default setup to be stored in NVRAM. Then a simple
ATZ should be the only thing required. This is how my modem
is setup, and it makes setting up dialers quite easy.

Thanks,
I used print fre(0), and it returned 3867392, so considering tos and basic

being loaded it looks like I have 4 megs after all.
Oddly though, when I used "print peek(&h42e)" it returned a value of 64.
peekl and lpeek wouldn't work.It said "subscript out of range".

64.
> peekl and lpeek wouldn't work.It said "subscript out of range".

The 64 returned by your question is simply the upper sixteen bits of the full 32 bit amount (in hexadecimal it's "0040"). The least-significant sixteen bits (stored at &h430) should be all zeroes.

In this case, for all known legal RAM values for an ST/STE computer, you'd get:

```
    8 = 524288 = 512k    (hex: 00080000)
    16 = 1048576 = 1 M    (00100000)
    32 = 2097152 = 2 M    (00200000)
    40 = 2621440 = 2.5 M    (00280000)
    64 = 4194304 = 4 M    (00400000)
```

In case you're wondering, the address you are peeking at is what is called a "system variable", and is stored in RAM by TOS after it starts up and has worked out how much RAM you have installed.

If your machine has "alternative" or "TT" RAM, (this requires a 32-bit CPU ie 68020 or better) then look at the four bytes at address &h5a4 will tell you the end of "alternative" RAM. If there isn't any, then this location should contain the value zero. If not, (assuming you only retrieve the upper 16 bits at the address, rather than the 32 bit value required) then subtract 256, and then divide by 16 and you will get the amount of alternative/fast/TT RAM.

(Note to the programmers out there : the addresses I've given in these articles are in protected memory, so you must be in the 68k CPU's "Supervisor mode" to access them, otherwise you'll get a multi-bomb crash. Basic appears to do this mode-swap for you)

As long as your machine is fully TOS compatible, the addresses I've given you will work on any ST/TT/Falcon/clone machine.

I've just had another thought:

If you have "Enhanced ST Basic", it had PEEK_L instead of PEEKL.

So, "PRINT PEEK_L(&h42e)" would give 4194304 in your case - meaning 4 megs.

(I haven't tried this, as I don't have ST BASIC handy on my TT, but it may be of some help for you)

You are correct! :)
Peek_L(&h42e) did indeed work and gave me a value of 4194304.
Thanks, this has been really informative.
What books would you recommend for more info like this on the STe?

Thanks,
Dan

Scooter has a Platine-Scooter format converter, but it looks like you need the library file from Platine as well.

Perhaps there is a demo version of Platine that could be used to print the file in question.

Chalk this one up as a stupid thing to do. Exactly how much voltage runs through an ST keybaord anyway, I had my ST apart, withthe power on doing some testing and I set the keyboard down (with Mobo rf shield off) onto its mount and WooHoo I got a heck of a jolt, the ST never skipped a beat, but I think I did my arms were a tingling, Stupid, stupid, stupid, yes I know better, and now I really know better ;-)

Most of the ways I used to learn about the ST in the late 1980s
(magazine articles, series, books etc) I no longer seem to have
available, unfortunately.

The first place you should try is always your local user group. They
usually have books available for the enthusiast, and users that are

usually within a local phone call that can be very helpful.

Assuming you know how to write software, there was a "memory map" book/leaflet detailing the ST memory map.

Programming the hardware of the ST family is generally a matter of putting a value into an address, with an operation similar to the BASIC "POKE address, value" command.

Reading through some of the memory maps will give details of what a computer and/or its OS can do.

And, if you can lay your hands on the Atari Compendium book/CD, then that is a very good source of info about the computers OS and hardware from a programmers point of view. (Rumour has it that it was available on the net somewhere, but I cannot recall ever seeing the address of where this info appears on the net)

I've no idea off hand of the voltage.. but, I did something similar with
my Lynx handheld.. and boy did I get a surprise, high voltage enclosed
or what... it must have killed most of my brain cells (that's my excuse
anyway:P)

Heh 5v, you must me a lttle weak! No what may of happened is you
touched the end of the keyboard on the PSU heat sink which are live.
I can't see how the ST didn't collapse though....

Hi there,

i have an awful problem with my Milan keyboard:

1. After booting up my Milan my keyboard does not respond to my
keystrokes... NOTHING

2. I have to pull out the DIN-Plug and replug it in the Milan and then
everything function very well...

3. During the boot procedure the keyboard is initialized and showing the
Numlock LED ... and i may toggle the CAPS LOCK LED by pressing CAPS LOCK....

but when the Milan LOGO on white background appears the keyboard fails...
then i have replug the DIN-plug.. :((

WHAT THE HELL IS THIS?

Anybody any ideas?

Greetings from Germany

Johannes

Does the Lynx have a backlit type thing. I haven't seen my friends
one for years. It may have been the inverter in that giving you a

belt.

Don't know about the voltage of the Lynx backlight but on my Game Gear the
backlight switches on at about 550v. Certainly enough make you think twice.

Don't worry though, your not alone!! I was servicing a laptop LCD Screen and
stcuk my finger on the inverter circuit. That hurt for a while, made my arm
ache.

Tim

```

Hi there,

I just purchased an Atari STe again (having sold my first one due to money problems). Since the local shops stopped selling ST stuff a long time ago, I was wondering if it would be possible to connect a regular IDE harddisk to it?

Greetings,
Marc

That ain't nothing really. I burnt my fingers on an ancient SMPSU
that had a couple of 100uf 400v caps. My arm was waving around all
over the place. In fact I'm in the process of getting dud PC PSU's
and ripping the caps out. I'm gonna bank them all up and make a
inverter running of a couple of AA's. I've got 700uf so far...

Mario Becrofts IDE adaptor works a treat. Have virtually any size HD
(using a better OS than TOS like Magic, Mint etc). Just avoid Western
Digital and some IBM models. ASP sell them in the UK.

There is one simple cure for all of this. Mario Becrofts QWERTY.
Great product!

May not be the answer you specifically want, but this product is nice and gives you the ability to use PC keyboards and mice on your Atari. When you consider that one replacement mylar for the TT keyboard will buy you a decent PC keyboard or a few cheap ones, it works out in the long run.

Why do you need such a long string, my USR 28k8 and my previous 56K
needed only ATZ once it was configured correctly.

Hello Everybody,

it's me Ben again. Please forgive my Rash, Jumping of the gun. I found what I was looking for on Gribnif Software's web site. It looks like their still in business and I may buy more of their Software. If I can get support for CardFile first. I can't give you address info now, but I found them on www.search.com searching under either (I think) Gribnif or Gribnif Software. Thank You for your support.

==Thanx==
===Ben===

Hi Lyndon

>That ain't nothing really. I burnt my fingers on an ancient SMPSU that
>had a couple of 100uf 400v caps.

What a boy!, you aint lost your techno-cherry until youve held a live
mains chassis, whilst earthed with an aerial lead, whilst trying to look
up some babes skirt, whilst she giggles to her mate with the big boob's,
"look, he's getting a shock"

Not a bad day, pronounced dead, resusitation attempted just in case and
still finished my work after discharge.

>My arm was waving around all over the place. In fact I'm in the process
>of getting dud PC PSU's and ripping the caps out. I'm gonna bank them
>all up and make a inverter running of a couple of AA's.

Car batteries are more use, you should design a switching circuit that
will connect them in paralel acroos the battery to charge them, and then
switch them in series, in series with your cats testicles.

>I've got 700uf so far...

Wow, and there's me sitting here with 2000uF in one can.

Yeah, alright, but I can't be bothered to buy them new.  These aren't
the sort of things I have kicking around, never needed to make a SMPSU
before.  Best I can see in my catalouges though are 200v @ 10,000uf or
450v @ 4700uf or even 600v @ 2200uf.  Not bad caps, by BHC Aerovox, but
```

when that 600v cap is just under 100 ukp, I don't think so.

Maybe I should try one of those designs for a home made Tesla Coil!
:)

I think this is getting a bit OT!

SS> on successfully to my ISP,
SS> Why do you need such a long string, my USR 28k8 and my previous 56K needed
SS> only ATZ once it was configured correctly.

For the last seven months or so, it's been getting harder and harder for me to establish a connection with my ISP. It would connect alright, but the PPP authentication would fail or time out. Finally, I was completely unable to log on at all. Their tech support guy invited me and my TT down to their office where we tried another modem - which worked. We then extracted the INIT string from the Modem script used by a Macintosh, and tried that, and lo and behold, my modem was able to make a connection. Unfortunately, this string is about 40 characters long - more than the fields in either STING or STIK2 allow.

I know that there is a way to store this string in a memory in the modem, but I need to find the command codes to do this (I suppose from a terminal emulator). Any suggestions?

Thanks,

AFAIK, the only high voltage present in the computer is the line voltage
of the incoming power supply, plus slightly higher voltages in the
switch-mode circuit which is often present on the heat-sinks of the
relevant transistors. Your hand must have strayed into that area...

To return a little to the original subject of this thread, if the clock
of the complete system were raised to 12MHz and the processor to 24MHz
it would not matter so much if the alternate RAM were not "fast".

cu.

Not much fuss here. Basically, you divide DRAM into even and odd words.
When you access even bank, odd is refreshed and vice versa. Simple and fast.
Doing that you mainly rely on the fact that 68000 has to access two consecutive words after

the instruction being executed, hence there is no way that one bank would be unrefreshed.
I have done this on 68008, but I think it still holds water on 68000-will check.

I have thought of that. I have to ask- is using CPLD acceptable ?
I know that many of you don't have the neccesary software, but what if programming software

is downloadable freely over the net and cable for programming is a few simple wires on the
parallel port ? That way anyone could make his own programmer in half-hour and program the
code into the chip all by himself...
It should be perfectly doable with simple TTL, but extra bells & whistles (like IDE, TOS
2.06,
maybe turbo switch etc.) would be done MUCH more nicely within small, simple and cheap
CPLD.

My thoughts exactly. I have used 8 x 74HCT374 and 8 x 74HCT244 on the QL
to give me 8 input and 8 output ports. SImple and cheap stuff, but surely effective...

Regards,

Branko

I have a TT with a German TOS in it, I really need to change this to a UK versions - any ideas how I can do this???

If it helps I think it has 4 TOS chips in it.

Thanks

Yep, I think that what happened on my STe.  The board I made worked
fine on an STFM.  I'll have to get a 16mhz part, or use a 74HCT74 to
divide 32mhz down.  Funny though cos my IDE interface uses the 16mhz
and that works fine!

Hi, Jo;

It happened that I looked at Atari "Memory Map" and I remembered that
you said you wanted to put ADSpeed int Stacy. Notice, in the extract
from the memory map below, that ADSpeed and IDE controller apparently use
the same address $F00000 for their own purposes. You may get come conflicts...

```
##############ADSPEED Configuration registers                      ###########

Hmm, not good :-(Anyway, do you know where I can get a 16MHz 68000? I
broke mine when I tried to overclock it...

>this on 68008, but I think it still holds water on 68000-will check.

I am afraid I don't quite understand this; but isn't it indeed some
68008-only stuff? Surely 68000 can access two banks (do you mean even/odd
byte?) simultaneously, as it has a 16-bit data bus. I have looked at the
specifications for 68000 but could not find anything similar to this
"accessing two consecutive words after..." ; can you, please, explain
a bit more?

But there is much more to DRAM controlling, isn't there: address multiplexing,
timing of RAS and CAS signals, address counting for refresh, etc. That is
why I contemplated using the old MMU for both the ST-RAM and the alternate
RAM.

>I have thought of that. I have to ask- is using CPLD acceptable ? I
>know that many of you don't have the neccesary software, but what if

This is interesting, of course. Can you point to where such software
and documentation can be found on the net? I am afraid that the software
will probably be for a PC, won't it?

>> On the other hand... it has occured to me several times that it would be SO

How about agreeing upon a location where the addresses of those registers
would be in the memory map so that hypothetical upgrades that need
control signals can refer to that?

I will try to make the 12MHz accelerator and I have decided to tackle the video resolution/sync problem first, so, for a start, I will build a simple circuit that generates sync signals at proper frequencies, and then try to declare to the computer that the syncs are external. However, it turned out that I can't get an oscilloscope home for a few weeks and I am impatient to try this; so: can some kind soul please help by measuring or by looking into documentation (I know i have it written down -somewhere- but I can't find it):

* What are the lengths of the horizontal and vertical sync pulses?

* What happens to hsync when a vsync happens: does hsync precede vsync,
  follows vsync, happens simultaneously or not at all?

Thanx in advance.

Did it overheat, or just blow?  Anyway, the only place I know where
they still sell them is Farnell, these are Hitachi 68HC000 at 10Mhz.
Price is about 14 ukp (includes VAT).  I'm sure this would go up to
24Mhz, maybe even 32Mhz, but you'd have to fiddle.

I'll see if I can find one in an old Amiga or something first. I believe
any 8MHz 68000 should run fine at 12MHz.

I knew it had to be something like that. It is hard to destroy 68000 just
by overclocking it.
Piece of advice, try to find 68HC000 with 20 MHz freq. limit-or at least 16
MHz (those are based on smaller
geometry and should be much more overclockable).
If you can't find DIP packing, you will have to wire adapter for PLCC...

Branko.

Trick is in dividing memory into even and odd 16/bit words. This is done to
simplify refresh.
So, when CPU is accessing one bank, logic refreshes the other. There is no chance
that CPU will ever
have to wait for refresh cycle to complete...

Not that hard. For adress multiplexing one needs 3 x 74HCT157 mux chips and all control signals can be derived from CPU's CLK, LDS and UDS

There are many vendors, but my favorites are XILINX (www.xilinx.com) and maybe Lattice. Both have free versions of their software on the web and both have somewhere
also schematics of the download cable.

news:3A312292.58A575B3@avtomatika.com...

: Lets do some basic math:

(Lotsa clever points snipped)

I believe that color on SVGA is possible, but not by messing wit the source of the video generation. Instead one would need to intercept the signals at the video shifter side (those digital RRRGGGBBB) and feed them to a sequencer that would quadruple the value of every pixel. The quadrupling would look something like this:

Original video line (each letter is one pixel):

KSNSHDFKLD...

New double lines:

KKSSNNSSHHDDFFKKLLDD...
KKSSNNSSHHDDFFKKLLDD...

Each pixel has been repeated horizontally one extra time, and then the entire line has also been repeated. Our 320*200 LOW became a factual 640*400 on the output side of the sequencer. But we still see only a 320*200 resolution on the screen. This would allow for outputting twice as much data with the double horizontal frequency (some 31KHz) during the same timeframe it takes to draw one line in ordinary LOW mode. The vertical frequency would likewise become doubled to 100Hz (120 Hz for

NTSC systems). The work of the ST is entirely unaffected.

A sequencer could be a PIC and some RAM, or possibly a list of values in an EPROM. After the sequencer some D/A conversion would be required, maybe modelled after the existing one in the ST, a resistor net.

Ideally one would make the above a bit more complicated to instead exactly fit the typical normal VGA sync expectations, which would allow for the use of really inexpensive monitors found at swapmeets etc. Taking this a bit futher would perhaps allow for creating extended modes with software only?

Yes, but there are some problems with that either.
I believe that some STs could spit even medium res on VGA monitor without
too much rework. Basically on ewould need TOS 2.06 within fast EPROMs (+ IDE interface
as an extra bonus while at it) and memory expanded to 4 Mb with modern 4 MB 60 or maybe even 70 ns

SIMM DRAM. Then one would have to replace main oscillator with 64 MHz
and take care of old clocks for ACIAs,
sound chip, FDC etc- not too hard. Oh yes, CPU would have to be
replaced with somehing a bit more modern and CMOS, like 68HC000FN20 or
something like that.
Then he would have medium resthat could be overscanned nicely and still
fit within VGA frame.Even low res would work, but it would have odd
aspect ratio (320 x 400).
Monochrome mode would have too high frame rate for most small monitors,
but should work on some 19"and bigger
(144 Hz is a bit high). But it could be nicely overscanned, maybe up to
1280x1024.
Everything else seems a bit too much work for little effect.

Your solution demands use of special hardware that would buffer whole
lines, which could be come as complex as
redesigning of whole video circuitry from scratch. Besides that, if you
circumwent shifter, how will you replace its color pallete ?
I think that some Amiga users can tell you that they had something like
this for Amiga. They called it deinterlacer. Thing have had doubled
every line from computer and has send picture to monitor at double line
rate. But it wasn't cheap.

Regards,

Branko

Hi Mark

>I have a TT with a German TOS in it, I really need to change this to a
>UK versions - any ideas how I can do this???

You could fit a English speaking TOS, or better still, use MAGIC, many
advantages.

User-Agent: tin/1.4-19991113 ("No Labels") (UNIX) (SunOS/5.7 (sun4m))
Xref: supernews.google.com comp.sys.atari.st.tech:883

I have found that my ROMs are organized in 6 sockets with two chips which are left from the processor, standing in up-down direction.
These are the general specifications:

OS	TOS version 1.02 DOS version 0.13 AES version 1.20
System date	22.4.1987
Country	Germany
Videomode	PAL
RAM total	1048576

720kB floppy disc drive
no hard disc

ST Bench gives 99%, or 200% with turbo_st.acc.

These are the parts, looking from the keyboard side:

board C070789-001 REV.D

processor	SC87896A8 MC68000 0B26M8749	U64

left from the processor are 6 28-leg IC sockets with 2 chips in them:

Hi-0	C101635-001 c ATARI 1987 38	RP231024E 0559 8748 Z04	U63
Hi-1	<empty>		U59
Hi-2	<empty>		U48
LO-0	C101636-001 c ATARI 1987 38	RP231024E 0560 8748 Z01	U67
LO-1	<empty>		U62
LO-2	<empty>		U53

If this is rom, can I put 2.06 chips in sockets instead of these two?
What should I do to upgrade to TOS 2.06?

Another thing, I can't find the Dram memories today, and don't know how to connect the simm board. I have found some info (simm.zip) on German on atarihacks.cjb.net but is not much use for me, since I dont have Platine ST and don't know German to well. I can buy 16 Mb of 72 pin SIMM memory really cheap. Of course, ST would use only four.

You cant plug them straight in as they are 256k eprom's. You need an address
decoder. Have a look on atarihacks, there is more than one tos upgrade hack.
There are also a few memory hack's, the easiest way to do it is solder
simm's sockets via fly leed's to the main board.

I have the cable now but when had a look through my disks it turned out
that the program was a bare bones VT52 emulator.

Anyway, I have STinG now and was going to try to telnet to the PC.
The only problem (at the minute) is that I can't seem to get the serial
driver loaded.

I was attempting to follow the guide at:
http://www.mcs.drexel.edu/~unsilva/bredroll/magic/network.htm

Just to try to get connection established between the two machines.

In the auto folder I have (I'm using an Atari STe BTW):

STING.PRG
STING.INF ; pointing to a:\sting
DRIVIN.PRG
MFP.PRG
XCONTROL.ACC

When I boot all of the modules are loaded from the Sting directory and
then it says Sting (ver 0.12) installed.
Next is Device Driver Support installed and then Fast Routines for ST-MFP
installed.

When I open xcontrol from the menu it has loaded the 4 progs from CPX but
the serial port icon is pink, I'm not sure if this indicates an error or
not.

Then when I open Sting Port Setup, the option to select a modem is not
there it only gives me EtherNet and MIDI, etc.

Does anybody have any idea what could be wrong?

On the other hand, it may be an error in the listing of the memory map.
You can notice that the $F00000 address is out of the other addresses
range that ADSpeed uuses. Maybe it shoud be $F10000?

Anyway, do you know where I can get a 16MHz 68000? I
>broke mine when I tried to overclock it...

Uh, I am not exactly in the mainstream of world electronic components
trade... :) I have never done so personally, but some electronic hobbyists
I know here order   components from Conrad, Germany. It is not cheap,
but delivery seems to be acceptably reliable. I think that about a year ago
they still had MC68000, but I don't have Conrad's current catalogue.

Could you perhaps have any more information? I downloaded
simm.lzh - only document describing that, but it is on German and there are
.plt files which I suppose need Platinum ST or a similar program which I
dont have.

I am looking for description of what to connect, where, and what to disconnect on the board , and how and where to connect 72-pin socket.
Other thing which I don't know is can I use DRAM or SIMM memory and which is better.

DK

Haven't used Sting for some time now, but do you have serial.stx in the sting folder? On boot up it should report all your STX files, like TCP, Resolve, Ether, Midi etc etc...including Serial if you have it.

>documentation out there for these parts.

IIRC the MMU in a ST serves the CPU and the video circuit in alternate
halfs of the 8MHz clock cycle. Does someone know is it really so, and
is the data transferred RAM <-> latches in just one 8MHz cycle?
(the CPU uses about 3 cycles for read/write but that's another matter).

If the MMU operates this way, and if it refreshes the DRAMs whole page
by whole page, then a decoder for alternate (but not "fast") RAM seem
to be quite simple.

Hallvard Tangeraas <northstar2010@yahoo.no> wrote:

Good idea :)

> Atari VGA monitor adapter
> http://homepage1.nifty.com/cobap/atari/monitor.html

That does not more as to add an DB15 VGA plug to the atari.
13pin atari plugs are rare on asian world? :->

(But the wiring left picture upper row smels like an easy short
circuit..) Do not touch this while the machine runs ;)

> VGA monitor adapter (another site)
> http://www.avis.ne.jp/~fluffy/myu/atari/dis/dis.htm

Other way to build an atari 13 pin to vga adaptor..
With insulating tape and glue.. (What a mess !)
(Sorry, but that can be made realy better (and more stable))

> -------------------
> Using a PC mouse with the Atari ST
> http://homepage1.nifty.com/cobap/atari/mouse.html

Looks like to add an pc "bus" mouse to an atari.
Some english descriptions around. Also in english/german on DOITST

> Using a PC mouse (another site)
> http://www.avis.ne.jp/~fluffy/myu/atari/mouse/mouse.htm

Looks for me as they guys connect an other mouse to an atari.
That mouse must be had an specialy japan mouse connector before.
Solder points are realy a mess! ;)

> -------------------
> Making the ST keyboard external
> http://homepage1.nifty.com/cobap/atari/keyboad.html

"How" to made from an 1040/falcon case a "megaST" keyboard.
English/german description around somewere, read that longer as 7 years
before on an german bbs network called "starnet" Anybody down there made
this with an 1040ST.

Looks fine, but the "new" keyboard case is open backsides.. ;)
Better (faster) to buy an mega ST keyboard second hand.. :-)
(Needs also to build an keyboard adaptor)

> Replacing the floppy disk drive
> http://homepage1.nifty.com/cobap/atari/fdd.html

Descibes how to use an pc fdd on atari.
Switch jumpers from DS0 to DS1, the only way these drives would bee
accepted as drive A on older atari computers. Maybee must be not

translated. -Some- descriptions in english avaiable.

> Using a PC power supply
> http://www.avis.ne.jp/~fluffy/myu/atari/ac/ac.htm
> ---------------------

Does not more as to replace internal psu with an pc psu.
User had to watch "red" an "yellow" wires, looks as the picures do not
show the different colorised wires well. Wrong connection blast the
mainboard imeditaly. Described in german and english as long on
differend places. Also on DOIT-Archives.

On whitch way you found this pages? :)
Well, solderings on monitor plugs ec. looks like an hobbist do that.
Not one profi use insulating tape, glue, silicone or what ever.. :->

That�s bullshit for a long time stable and clean work.

Regards, Robert

Yep Atari's are good for sequencing:) in my opinion it is the best:

No timing problems
No additional hardware or drivers needed
original plug and play
use 1 machine to fire another machine/sequencer off

compact and easily transported: 1 mouse, 1 computer, 1 hi res monitor
(for Cubase etc) and 2 plug sockets.... ah bliss:)

Help

I have an Atari TT030, and the mouse, when connected, goes bezerk. When plugged into my Falcon, it works fine. Curious. The characteristics of "bezerk" are - cursor flys back and forwards, diagonally, clicks buttons at random. When unplugged it stops. I have tried several other Atari Mice - some work, most go bezerk. Keyboard seems to function - although, when I opened it, the IC smelt suspect.

Any ideas?

Yes I have them all and it reports them all, but when I go to select one in Sting Port Setup it only has Centronics, EtherNet, Masquerade and MidiNet.

The only version of Xcontrol I could find was in German, might this have something to do with it?

Thanks for the reply.

Hi all,

With great help from Dennis Vermeire, I have my Milan up and running again, except for one intermitant problem. The keyboard (an IBM type) seems to get very senstive in the region of the top left hand keys, starting at the 1 key and spreading to the 2, 3, q, w and e, and gives a string of 1s or !s whenever I touch one of the keys. This seems to stop when I unplug the keyboard from the computer. Any ideas please. it is particularly annoying when writing a mail or news111111111111111111!!!!!!!!!!!!!!!!!!!!!!!!!!!! in QED. It stops when I hit space. I use clocky for keyboard mapping.

Bob king.

Hi Bob

Surely this must be a hardware prob. Do you have another PS-2 keyboard at hand? In that case try plugging that in and see what happens. To me it sounds like the folio (or whatever it's called) inside the keyboard is starting to get worn out.

Sure it is. I have one also that sits next to my Hades. You can download alot of sequencing software for it at the site below:

Do you have some kind of program that affects the mouse loading in when the
TT boots up? Try booting  the TT with almost nothing loaded in and see if
the mouse does the same thing. If it does, it may be your mouse interface
on the TT.

Hi!

J�rgen Nyberg <jorgen.nyberg@mailbox.hogia.net> wrote:

> Surely this must be a hardware prob. Do you have another PS-2 keyboard
> at hand?

Just to note here that the Milan does not use a PS/2-connector for the keyboard, but an old-style 5-pin one (they're called "DIN"-plugs here).

Of course, you can connect a PS/2-keyboard using an adaptor (like I do), but some of these seem to not work properly (not limited to the Milan).

Ciao

Thomas

Strange - the only difference between the two types of keyboard is the
connector used, so converting this with a DIN/PS2-Adapter should work with
every keyboard and computer (I have not yet seen a single failure, but as
always, YMMV).

Well without reinstalling Sting I wouldn't know.  I'm sure someone
with Sting installed can help you.  I doubt having Xcontrol in German
will make a difference.

>opened it, the IC smelt suspect.

Hnmm sounds like a dodgy 6301 keyboard controller, or possibly one of
the ACIAs which communicates with the keyboard controller.

How did it smell, kinda burnt bacon?  How else do I describe what a
cooked chip smells like?  They seem to be socketed so you could easily
replace it.  Try swapping the two 6301's over from Falcon to TT.  Just
remember which way they go round and take the chips out straight.

Funny because my ST has same problems in the top left, but I think the
problem with mine is to do with the keyboard lead being over 1 metre
and not sheilded. Also it only does it if the CPU is under load, ie
playing a mod tune.

IIRC, it should be a Fujitsu "FM Towns" mouse, or perhaps a NEC PC98 one.

>On whitch way you found this pages? :)

I once found them when some Japanese bloke posted links to his Falcon icon
sets a while ago on c.s.a.st, then following his links.

How does one do it, then? I've soldered monitor plugs before, but the image
was very fuzzy (Mac adapter).

The price is hideous, unless it comes with some nice peripherals such as hard
drive, monitor and software.

Hi Thomas

Yep, you're right of course, maybe my brain is on the glitch ;-).
If it doesn't work using a adaptor, then it must the adaptor that is
faulty. IIRC the adaptor is just a straitthrough wiring thing.
Probably it's like any computer cabel, buy cheap and pay twice as much
since one needs to buy two cheap ones, to be sure that it works.

Iggy Drougge <optimus@canit.se> wrote:

> How?

Hard if no plugs avaiable.
Other way is to remove the original 13 pin DIN connector from mainboard
and solder any wirde directly to solder holes on main board. (Made for
use ONLY VGA displays) No glue, no tape and mostly short wires without
gnd shild :)

> IIRC, it should be a Fujitsu "FM Towns" mouse, or perhaps a NEC PC98 one.

Yep, maybee, i never see�n that mouse before. In early atari years i
made that with an simple cheap bus mouse. Works fine for years and the
mouse was faster as the original atari mouse. (without software)

(I remove the original cable from atari mouse and connect it directly
on the board on the bus mouse) Need�s no adaptor, no cutten plugs ;)

> I once found them when some Japanese bloke posted links to his Falcon icon
> sets a while ago on c.s.a.st, then following his links.

Great. I never see�n any japanese atari pages before! ;)
I was not sure they use atari in japan before. Great news ;)

> How does one do it, then? I've soldered monitor plugs before, but the image
> was very fuzzy (Mac adapter).

Yes, -some- adaptors, on which way ever, looks better as the picture
from this side :) Tape and glue are not the best materials to build an
video adaptor. Ahrg.. :)

As the jaguar comes up i build video/audio connectors nearly the
original that was selled from atari.

Materials are a smal cases, nearly C64 user port connectors, desoldered
slots from old PC main boards, shildet round cable and plastic hard glue
(only to fix the PC slot on one side to the middle to connector case)

That was very stable, no brocken solder points, loosed wires or brocken
flat wires..

OK it�s only an example. I�m sure ANY adptor on the japanese site can be
made cleaner ;-) Last, an stable adaptor minimise the amount of trouble
while touching the cable.

Regards, Robert

At the office, I already had two or three non-working adaptors. I can't
tell whether they were new, but the keyboards connected with them either
didn't produce any keystrokes at all or they were totally wrong.

Ciao

Thomas

Xref: supernews.google.com comp.sys.atari.st.tech:912

hello
I've started work on various soldering patches for the Falcon,
and have gotten as far as the audio patches.
I can get most of the surface mount resistors and caps,
but need to know the wattage of the resistors and the voltage of the caps.
I am not an electronics person, otherwise I would know this! ;-)
Can anyone tell me what wattage and voltage I need?

the patches are as follows

To remove the bass boost on the output:
Change C58 and C59 from 100PF to 1000PF.
Change R123 anr R130 from 10K to 15K.
Change R59 and R68 from 100K to 4.7K.
Change C95 and C90 from 0.033yF to 1K Resistor.

To reduce the speaker amplifier gain:
Add a 100K resistor between pin 2 of U21 (@R119) and AGND (@R111).

To reduce the Input Gain by 6dB:
Remove R56, R57, R90, R92, C21 and C81.
Change R66 and R87 from 100K to 1.8K.
Add a 470pF NPO +/- 5% in parallel with R67.
Add a 470pF NPO +/-5% in parallel with R88.
Add a 100pF NPO +/-5% in parallel with R66.
Add a 100pF NPO +/-5% in parallel with R87.

thanks in advance for any help.
thanks.merci.tussen tak.slainte mhath

please ignore my recent message in the newsgroups.
I should have remembered that I'd asked this question previously,
but forgot as I had to drop the project for a month.

On 2 Nov 2000 13:48:08 +, Jonas Klereborn wrote:
->Ken Macdonald wrote:
->

->
->The resistors and capacitors for the audio modification are surface
->mounted (SMD) and they have numbers corresponding to their size rather
->than the power rating. The original components are 0805, I think, but
->you could do with 1206. (I made my modification with 1206 because that
->was what I had at home.) The 1206 are a little bit bigger.

yes. I have 1206's as they were all I could find!!
but I am still missing a 1 000 and a 470 pF cap.
and a 10k and 100k ohm resistor.
I can't seem to get those caps or resistors in SMD, so will ceramic do?
The mobo is going to be recased in a large tower, so there is plenty
of room.

-snip-
->The F-series has a typical delay of 3ns per gate and the LS has 9ns per
->gate.The closest in time is the ALS (4ns) and S (3ns). The S has a power
->consumption of 20 mW per gate instead of 2 mW for the LS, 4 mW for the F
->and 1mW for the ALS. Pretty much any of these should do, but you never
->know. We are dealing with clock pulses here.
->You could also go for the HCT (8ns) that are suggested in some drawings
->of the clk-patch.

this mod is done!

->My suggestion is get two with different delay time and if one doesn't
->work try the other.
->The 47 ohm and 82 ohm resistors are for one version of the clk patch I
->think? These could and could not be surface mounted. It depends on what
->the person doing de soldering prefer.
->Good luck.

->/Jonas
->.
thanks for all your assistance!
ken

I was forced by extracurricular activities
to put this project on hold for a month, and forgot that I had
asked this question on 1 nov, and received some answers!
but there are still some questions I have! :-)

On 20 Dec 2000 09:09:30 , Ken Macdonald wrote:
->hello
->I've started work on various soldering patches for the Falcon,
->the patches are as follows
->To remove the bass boost on the output:
->Change C58 and C59 from 100PF to 1000PF.

can't find a SMD version. can I use cermaic??

->Change R123 anr R130 from 10K to 15K.
->Change R59 and R68 from 100K to 4.7K.
->Change C95 and C90 from 0.033yF to 1K Resistor.

got the above.

->To reduce the speaker amplifier gain:
->Add a 100K resistor between pin 2 of U21 (@R119) and AGND (@R111).

Claus Holmerup suggests a 10Kohm here?

->To reduce the Input Gain by 6dB:
->Remove R56, R57, R90, R92, C21 and C81.
->Change R66 and R87 from 100K to 1.8K.
->Add a 470pF NPO +/- 5% in parallel with R67.
->Add a 470pF NPO +/-5% in parallel with R88.
->Add a 100pF NPO +/-5% in parallel with R66.
->Add a 100pF NPO +/-5% in parallel with R87.

can't find the 100pF cap in SMD. can I use another type?

thanks in advance for any help.

STinG should run _after_ HSModem, use a directory resorting tool to make it so (or copy the files to another temp. folder in the order you want them to run).

Hiya..

It strikes me that to get colour on SVGA, we just build the mono VGA adapter, but leav eoff grounding the mono detect ping and wire up the RGB pins directly instea dof the mono out.

OK, now the problem is the shifter is clocking out at the wrong frequency. We know the shifter can run faster (it does in mono mode) so why not just write a patch to reprogram the mono scan speeds into the shifter in colour mode??

: will hardly break the bank!

I bought it. Didn't work. It is year 1995 mouse. Not too old? I will try again with serial port. On box it says "PC serial mouse", so it's serial then. Driver for serial mouse and 9/15 should do the fun, I think. I will report when I suceed.

What you need to do is to intercept the hsync, vsync and DE signals from
the GLUE and generate them yourself. Overscan and LaceScan seems to do
this, but it only replace the DE signal AFAICS. I really don't know much
about the details here, getting hold of the C't article about their 12MHz
accelerator would probably help.

> What surprises me is that you could not get the colour output either.
> At 40MHz clock vertical frequency should have been 62.5Hz and I supposed

The problem is hsync, which IIRC is 15KHz on NTSC as well.

> Btw. it has often been mentioned here that newer colour monitors can't

> sync so low as the ST video output needs. Maybe by applying a patch

I don't think so, even with a 48MHz clock you'll still only get 22.5KHz
horizontal frequency, much too low.

> Anyway, it seems that a patch like the one you made may well become
> a "standard" and quite easy upgrade for STacies, siginificantly
> upgrading their performance. Good :) I wish I had a STacy too...

I'm writing a detailed description on how it works, I'll post it on my
homepage as soon as I find a way to sync DreamWeaver to my webserver
through a firewall.

> cycles through a next instruction, gets a false idea that a new
> access is already finished before it's even started.

I see. I don't think this is a problem with the ADSpeed, as it's extremely
stable. I hope I can test it at 12/24MHz this weekend :-)

This rather underestimates the problem.

Lets do some basic math:

ST uses 32 MHz oscillator, which drives video shifter.
Shifter divides that by 2 and gives 16 MHz to the rest of computer.
GLUE divides 16 MHz by 2 and gets 8 MHz to the CPU.
CPU uses 4 cycles for access to the memory (without waitstates). 1 cycle of
8 MHz clk takes 125 ns, so four take 500 ns. This also means that teoretical
limit
for CPU is 2.000.000 transfers per second.
Designers of ST took cleverly advantage of the fact that execution times for
most
instructions on 68000 is even. That means that if enabled 0WS work, the CPU
would
almost always started memory transfer at 2n cycle.
Why is that important ?
Well, in computer two devices eat majority of memory bandwidth: CPU and video
shifter.
Those two are major bandwidth loads. But the fact that they behave so
differently
complicates things even further. CPU needs fast access and is in general hardly
predictable- ie. one can't
predict time nor address of next access on the basis of previous (it is not 100%
truth, but lets leave it here), while
video shifter behaves very predictably, but it demands no waitstates and usually
quite high bandwidth.
All older machines with cacheless CPU (like 8086, 68000, IIRC80286 etc) had

suffered quite CPU performance impact due to videogeneration circuitry.
As said, 68000 uses mainly even cycles for starting memory access, or more precisely said, time of bus inactivity is even number of cycles.
Those days mainstream DRAMs had acces times of 150ns and they demanded extra 120 ns after access to be able to catch breath (precharge) of air before next access could begin.

Creators of ST did two important things:

-they have managed to shorten memory cycle time from 270 ns (150ns+120ns) to 250 ns
-they have enabled the CPU access on 4 cycle boundaries

Between consecutive boundaries is 500ns, which means time for two memory accesses. Forst is for CPU/DMA etc, while second is for video shifter. This means that video generating circuitry on ST can grab picture from memory at rate of up to 2MHz x 2bytes/access= 4Mbytes/second
When in monochrome mode, each access gets into shiter 16 pixels, so pixel clock is 16 x 2MHz=32 Mhz.
This means that each pixel lasts for 1/32MHz=31.25ns. Whole visible part of horizontal line takes 800 pix or 25 microseconds. Firts cca. 150 pix are black, 640 pixels are drawn from RAM and the last 160 pix are black.
There is also some extra time to accomodate beam retrace to starting position for next line, so each line takes cca. 28 microseconds.Since there are also top and bottom border, each picture frame has to have more than just 400 visible lines-more exactly 500. Top and bottom 50 lines are black or not drawn (during the vertical retrace)...
So, to draw a complete picture frame, video circuitry needs time for 500 lines. This means 500 x 28 microseconds=14 ms. Each picture frame takes cca 14 ms, so there are 72 frames per second.

This means that there is no way of convincing ordinary ST to draw a picture faster with equal resolution, border and retrace timings.

Similarly, in 4 colour mode one can reach only half as much pixel per access as in mono mode, so that means that ordinary ST will never be able to work in colour modes with ordinary VGA at 640 x 400....
This is not a problem of convincing shifter to work in colour mode, it's deeper than that.

I'm sorry for the length of the mail, but I feel that too many people here do not understand basic math with video access which is needed if one wants to fiddle with overscans etc...

Regards,

Branko

Thanks for all the help there guys.

I've connected it exactly how it is above, without resistors for the moment to simplify things. I'm still having problems getting the monitor to work though. When the ST is booting up, there is a small white compressed section at the top. When it gets to the desktop the screen is just about viewable, but there are 8copys of the same image side by side! Also the screen is rolling onto itself, if you know what I mean, it's very hard to describe.

It's all liney, and the monitor is giving a high pitch sound. Also palaying with the controls especially the "move screen from left to right" makes the screen roll and not synced. This should be a standard VGA according to it's manual. I'll have to try it on another monitor.

Anyone had any similar effects?

Lyndon Amsdon

Have you looked at the date of that news entry? Tomorrow, it will be 2 years
old, and announced the first released version of my SCSI driver!

That can only work if the IDE interface has additional addresses / chip
select lines available to start with. You will need logic to decode the
extra addresses and route the CS signals only to one of the two busses

depending on a previously unused address line.

A standard IDE interface can olny support 2 drives per IDE BUS. The Milan
has two completely separete IDE busses.

However, note that the falcon's IDE bus is already critical with short
cables and 1-2 devices. Adding an additional length of cable and loading
that with more devices will not improve this.

Wrong again :) It is A1 to A23 and there are UDS and LDS which are not
exactly the same as A0. Just be careful that slips like that don't

result in some barbecued hardware :)   So, your chip-select decoder(s) will have to have as inputs A22, A23, AS, UDS and LDS to enable proper byte-access.

>I think 4mb SRAMs are about the highest they go, without spending HUGE

Ok, you mean 4M-BYTE, not M-BIT don't you? Have you acquired the name and pinout of those yet? I would be interested to see that pinout list if you can email it to me.

When I went for a walk this morning I checked a couple of shops that sell chips nearby here, just to see what is their current assortment of SRAM chips- and it turned out that at the moment they don't have any at all! Funny attitude in an age of computers and electronics...

>That's a really cool idea Djordje! I have some ORs/ANDs kicking
>around, so I'll get this mounted on some breadboard at the weekend,
>with a small signal trany for the /DTACK.

Maybe it would be good to check somehow in this excperiment that the old 4MB don't get addressed when you address the 4-12MB range. maybe by looking into the read data to see if you get all 1111...s (or maybe 0000...s?). If I understood correctly that which I read about Glue and MMU chips, some of them may handle this inconveniently, so that the poor MMU may think that it has been called and turn on data from the old ST-RAM.

Cu.

>They should work, indeed.

I take this back. It is quite posible that 74HCxx would not work. I have looked at the specifications for 74HC00 AC characteristics, and they say that typical output transition time is about 7ns (propagation delay is about 9ns), and in a worst case can be as high as 15ns. Now, at 48MHz and 50% duty cycle, one half-cycle pulse is only about 10ns so it may be that the 74HC00 just doesn't have enough time to create a decent pulse with clearly defined logic levels. If your wiring was, as you say, a bit untidy, with largish capacitancies, these transition times may get even worse. Probably 40MHz (12.5ns half-cycle pulse) was near the limit for this chip type.

So it seems that 74Fxx should be prefered over 74HCxx for switching at 48MHz, because 74Fxx have only 3ns propagation delay and similar transition times. (74Fxx have higher power consumption and are more noisy, so they need good decoupling)

On the other hand, maximum clock frequency for 74HC4040 is about 85MHz (72MHz for 74HCT4040), though in a worst case can be as low as 30MHz. Typical clock pulse width should be about 5ns, and it is very likely that a 74HC4040 (or 74HCT4040) would be OK on a 32MHz clock.

Cu.

I'm sure you wouldn't need UDS, and LDS. Is'nt memory always
accessed 16bit blocks at a time? If it wasn't it would be very simple
to implement, as the fastram will be organised as two 8 bit memory
chips. UDS and LDS could be gated, with the out of the address
decoder to the CS pins.

I'm sorry. I'm talking about 4Mb chips. I really should be using the
right terminology! As for make I think Hitachi would be the best that
I can get hold of. They're 4Mb (512k*8), 32 pin. I can't understand
how they're only 32 pin. Adrress lines are 22, Data are 8, that only
leaves enough for power! They're not multiplexed are they?

Well, I connected a decoder for the 4-8Mb section of memory and ran it
via an open collector trany to the /DTACK line. It still bombs if I
poke (basic) to that range. I checked with a scope, but my scope
ain't fast enough. Maybe /BERR was getting in there too fast.

I know, if I pull out the /BERR line (string it to +5v) and then put
the decoder in again and connect the output to /BERR, I should be able
to see if the decoder is working. Or connect it to /DTACK, and see if
the computer carries on perfectly. In fact, we could do that,
intercept the /BERR line and only let the output from the glue go to
the CPU, *IF* it's not accessing the 4-8(12) Mb section. This would
be simple as it's related to the address decoder.

Or do we really need the /BERR line connected??!!

You will need LDS and UDS on write accesses, since otherwise a byte-write would overwrite the adjacent byte in memory.

There must be a R/W and at leat a CS pin somewhere. But wait - 512K is just 2^19, so there are only 19 address lines, so that leaves enough pins.

>>Maybe it would be good to check somehow in this excperiment

No, ST-RAM is not accessed at adresses above 4MB. The MagnumST does just this: add memory above 4MB, and generate DTACK for the CPU - however, it is a bit more complex due to tue use of DRAM instead of SRAM.

Note, however, that on 4MB ST-RAM systems, there *must* be a hole after 4MB (where no DTACK is generated) after reset, otherwise, TOS will happily test your memory and put the video memory at the end of the first memory block, which it not in ST-RAM any more!

>Well, I connected a decoder for the 4-8Mb section of memory and ran it

No - you have something around ~100 clock cycles before BERR is signaled.

>I know, if I pull out the /BERR line (string it to +5v) and then put
>the decoder in again and connect the output to /BERR, I should be able

>to see if the decoder is working. Or connect it to /DTACK, and see if

That won�t help - BERR is generated as a timeout if no DTACK is seen. If you
disable BERR, the machine will hang indefinitely without DTACK.

>the computer carries on perfectly. In fact, we could do that,

>Or do we really need the /BERR line connected??!!

Yes - and cutting is is just a band-aid for very bad design - this is
absolutely unnecessary!

I'm must be stupid, but, isn't an 8bit memory chip with only 2^19 (524,288
different combinations) going to have 512k? Each combination holds a
byte of memory. The ST has 23 address line, 2^23 is 8 Mbytes which is
right.

Yeah I knew that, as it is 16 bit wide, but is the top bit correct?

I don't understand quite the fuss about MC68000 address bus.
I see that everyone undestands databus, as there are no complications there. 16 lines /D0-D15/ can manage two bytes and two DS signal strobes /UDS and LDS/ activate appropriate half or whole bus as needed.
Address lines are obviously a dfferent story.
Theoretically, 68000 should have 32 adress lines as it has resources for adressing 2^32 locations. Note that I have said LOCATIONS, not bytes. This would mean 4G locations x 2 bytes/loc= 8Gbytes.
If implemented that way, 68000 could also make much bigger relative jumps etc (now it's only +/- 32 Kb, but it could be +/- 128 Kb)
But then there would be no easy route to make 68000-compatible CPUs with differently sized data bus, like 68008,68020, 68030 etc.
So, designers took a different route. Address bus always adresses first byte of desired word, regardless of data bus width.
On 68000 this means that A0 is unnecesary, since A1-A23 carry information about desired word and UDS&LDS activate right byte lanes on the data bus. Because of that, 68000 and 68HC000 don't have A0 pin.
But on 68008 one can find A0 line, since the CPU has 8-bit data bus and it also only needs one DS.
In fact CPUs like 68EC000, 68SEC000 and 68HC001 have also A0 adress line because they can work in both modes: 16-bit 68000 mode and 8-bit 68008 mode (they have MODE pin for databus width selection).

Regards,

Branko.

BTW: I have also been looking for SRAMs and everything that I have found is either in 36-pin or 44-pin housing.
I have found nothing in 32-pin packing, but I was after high speed SRAMs.Low power ones might differ.

The mouse will not work in the ST's Mouse port, the protocol's PC mice and
Atari mice use are chalk and cheese. There is software to enable you to use
a PC mouse under TOS, but this will not work for Games etc. Try System
solutions or Keychange for an ST mouse..

I found once on dejanews an old thread in an atari newsgroup, discussing
RAM expansion above 4MB and it was rather positively stated that not all
Glue chips behave the same regarding this matter (addressing 0-4 and 4-8MB,
bus error, etc) - I don't remember the details- and those produced by IMP
were quoted as not suitable for RAM expansion

>Note, however, that on 4MB ST-RAM systems, there *must* be a hole after 4MB

>your memory and put the video memory at the end of the first memory block,
>which it not in ST-RAM any more!

A good point, AFAIK if the addresses are contiguous, TOS would conclude
that all that memory is ST-RAM (which it isn't, of course). Instead,
TOS should be informed at or after boot time (by a suitable small program?)
of the size and starting address of alternate memory.

Ahm... err... Hm... Lyndon... I looked at a Hitachi web page... and
those 4M, 32-pin 512k*8 SRAMs... like, for example 628512, they are
FOUR MEGABIT chips, clearly marked "BIT" not "BYTE" on top of the page...
so each chip is only 512 KILOBYTE, and the numbers of pins, address and
data lines etc. make sense. So, at about 30 ukp/megabyte I don't think
you will be getting much RAM into your computer this way. You should
not go round disturbing the unsuspecting population with talk about four
megabyte static RAMs :) ...

Seems to me you are a bit hasty :) so maybe you have made some error
and your circuit doesn't work properly. And why don't you use for DTACK
output a proper open-collector TTL which would be sure to handle the
frequency, logic levels, etc.

>I know, if I pull out the /BERR line (string it to +5v) and then put

>
>Or do we really need the /BERR line connected??!!

I don't think it would be wise to abolish /BERR. It is there for a
good reason.

Cu.

OTOH those chips have one very nice feature. They can have access time as low as 10-20 ns !!
Theoretically that should be good for up to 100 MHz...
Paradise for overclocking...

Branko

I was looking at an advert in an electronics mag, and they listed the
628512's as 4 mega byte, actually written. I assumed that was
correct, obviously not.

I give up, I'm not clever enough, if I can't even work out
things like that. I'll keep out of this discussion, from now on.

No need to. If you are eager to make 4 Mb DRAM expansion, I can draw schematic
for you.
I can't guarantee that it will work on the fisrt try, but we'll get it to work
eventually...
Hmm, better yet, make that 8 Mb- since RAM is quite cheap these days...

Regards,

Branko

>right.

Yes, sure, now what is the problem? 2^19 is 512KB which is 4MBit - I don't think there are bigger asynchronous SRAMs available, and you wrote about a 512K*8 SRAM, right?

The 68000 has 23 address lines, which makes 8MWords, each of two bytes, yielding 16MBytes of total addressable memory.

(Although I still would not bother to wire static RAM to a ST - you would
need lots of them to even get to 4MBytes, and DRAM is a lot cheaper!)

The MagnumST RAM card works just fine in any 1040ST/MegaST, regardless of
the chipset (IMP or not).

The IMP chips behave differently, but RAM expansion works fine - you won't
get bus errors if you supply DTACK in time (which you have to do anyway).

That's just what the MagnumST does.

If you dont have other (religious ?) reasons not to do it, there are no practical
reasons.
Those things may be done with ordinary thin wires- no need for special PCB.
Believe it or not, all my ST memory upgrades were purely wire-jobs, and I have
upgraded probably more than
500 machines. If you are quick worker, you can wire up upgrade in some two hours
with 1Mx8 SIMMs and even
less with 4Mb 72 pin SIMM.All that with only SIMMs-no extra sockets, connectors
and
other faggotisms.
No need to bother with profi PCB either.

This expansion would be slightly more complex, but still very doable. If you wish,
I can show you some practical tricks too...

Regards,

Branko

Does anyone know if this is possible...?

I was thinking of connecting the 25pin serial port on the Atari to a 9 pin serial on my PC.

I seem to remember having some sort of Emulator (V25 I think) on the Atari and was wondering if I could use it to connect to the PC (while using Linux) and use the Atari as a dumb terminal or something.

I did check the networking section in the ST FAQ but it didn't seem to cover this (or I missed it :)

Thanks for any help.

Now that sounds like a plan. Could you forward the scehmatics to me as well,
I have a couple of haced ST's which I would give it a go on;-)

Mark

PS 8MB would be good, isn't 16MB impossible, due to the ROM's address?

This will work. but you will need a null modem cable.

The Amiga solution Lyndon mentioned does AFAIK use multiplexing. Additional
driver software is needed for the second couple of drives to be recognised,
though.

Hmm, I suprised you can do it without a PCB. I was looking at a DRAM
controller and it was 84 pin SMD, so there obviously is some trick!
I'm really interested as I never knew it could be that simple.

> PS 8MB would be good, isn't 16MB impossible, due to the ROM's address?

Keep the old MMU's 4mb range for comapatibility and the top 2 mb or so
is taken up by memory mapped devices, like MFP, Yamaha etc...

The MagnumST uses 2 TTL multiplexers (74F157) plus a MACH210, which comes in
a PLCC44 case and can be easily socketed.

>Keep the old MMU's 4mb range for comapatibility and the top 2 mb or so

You can get up to 15.5MB of total RAM, or 15MB if you are using TOS 2.06.

Hi guys,
I'm looking to buy a Falcon and wondered what I could get for my MSTe.

Here's the specs:
Motherboard mounted in sun tower case. Could fit in TT case if necessary.
4 megs of RAM
Mega ST keyboard and Mouse
VGA video adapter (ST High on VGA)
PC Power supply
1 Gig Seagate Hawk SCSI hard drive
1 2X SCSI CDrom drive
1 720K floppy drive
ICD Link 2 / Limited see-through case edition

Some other things that may help here. Is that this MSTe mobo is the newest you'll find. It was a purchase from Toad computer's going out of the atari business sale back in 1995-1997 (can't remember). It was new and sealed at this point. To date I have had no hardware troubles of any sort. The motherboard is still in like new condition with the exception of the RGB monitor plug which I slaughtered to make my VGA adapter.

The case is a VERY heavy steel case from an OLD OLD sun photo processor. It was the only case I could find that really suited my needs. It weighs in near 100 pounds I'm sure so shipping will NOT be cheap. I could put the machine in a TT case but then you'll have to work out power and some other things. The keyboard included is from my old MST4 and can be flaky at times.

I'd look for $300 for this setup but I am willing to negotiate. I may also completely change my mind about selling it with warning to a potential buyer of course. I'm not in any crazy rush to sell this and I love it very much.

A final note, this machine has some particular bug which entails a press of the reset button after powering it up. I have no clue why, but it's really not a big deal.

Please respond via email.
Thanks
Sincerely,
Mark Duckworth

Don't know if it's possible with the V25 emulator, though with Sting it
is perfectly possible :

check out the last link on :

http://gallery.uunet.be/saka/atari/lan/index.htm

Think you will find on that page how to setup the pppdeamon. the v25
emulation will be used to make the "dialup" connection.

> I did check the networking section in the ST FAQ but it didn't seem to
> cover this (or I missed it :)

Not explicitely... think no-one thaught about it.
Let me know something how it works, THX.

Oh, please, don't. A healthy enthusiasm like yours is quite valuable,
and you can have good ideas and projects as well as anyone else.
I am sorry if I offended you, I surely didn't mean to.
This has not been a case of cleverness or stupidity, but just of
misinterpretaion of a probably obscure advertisment.

If I may say so, I would like to see such a circuit too. I have a
feeling that alternate-RAM expansion can be made quite simply, if one
has required documentation. In fact, I am amazed this has not been
done much more often and that it has not long ago become a "standard"
expansion for a ST. Some preliminary considerations made me think
that the existing "MMU" (which is, in fact, mostly a DRAM controller),
could be used with just a little external hardware, if I knew exactly

the behaviour os some of those control signals that go into MMU.

Cu.

Like so many times before, I'm afraid I'll have to leave you waiting for some time.
:-(
Working tempo is killing me...
I was about to make instructions for quick&dirty 4Mb expansion and even took some pictures,
but my camera isn't very good at closeups, so everything came out blurry.
I need a few days for a second trial...

I have a friend who has his TT connected to his PC via NetBSD. He also
connected some ST's to PC's via OS-9. I am sure he could help you. His
email address is: mike@cpdist.com and his name is Mike Sienicki.

I agree totally. The docs for 16mb on a ST are pretty poor and out of
date, with little explanation of how and why it works.

>Some preliminary considerations made me think
>that the existing "MMU" (which is, in fact, mostly a DRAM controller),

Yep. Atari had to design major chips (Shifter, MMU) by themselves, to
keep costs down. Bad point is that there is little or few
documentation out there for these parts. Also they all rely on each
other /too/ much. Problem is that the DRAM controller is squashed
into a big SMD (with glue, blitter(sometimes)) so accesing it is
more difficult but it could be done.

The reason why I wanted to make the extra RAM was so I could clock it
with the CPU at whatever, hopefully 32mhz with IDE at same speed.
Using the old DRAM controller would mean the ram would be same old
slow 8mhz stuff.

Hey, don't worry! I've had to put up with this ST as my main
computer, so I think I can last a few more months! Is this using
SRAMs, DRAMs? Using the old controller?

It's plain old 4Mb expansion for a start. Whole purpose should be to show folks
that it
could be O.K. to cut some
corners. It looks scary, but it works 100.00% !
Part 2 (extra 8Mb) is due in a few weeks and I expect some cooperation here. I'll
do a
shematics but expect for someone to try it and report behavior. 8 Mb DRAM for
68000
should be no problem, but I expect some stumbling over ST-specific stuff.
Someone said that extra memory should not follow directly main 4 Mb as ST might
try to
put picture there.
What about having those 8 Mb directly following main 4 Mb but with special extra
gate
that disable its correct operation until after reset routine ?
Detectin write to sreen start address register might be good trigger for that...
Just a thought...

Regards,

Branko

If I had it understand well, moving from a 720kb to 1.44mb floppy,
if I don't want to use 720 mb discs any more, consists of four steps:

-disconnect the input clock (8Mhz) from WD1772 02-02
-connect a 16Mhz signal from video switcher to WD1772 02-02
-replace the drives
-get the program which formats 1.44Mb with 6ms steprate

And everything works fine. Or not?

DK

It will work fine for HD disks. Yes.

But it won't work for DD anymore, These require an 8Mhz signal.

Yep, should do. Yes there may be problems with the FD controller, but if you take care with routing the 16mhz wire, keep it short, and that may help you. Put a dinky little switch on the back to switch back to good old DD mode.

The best way to go is to put a small circuit in to automatically tell if
there is a Hdd in the drive. You can use just a couple of LS chips, by using
the HD detect pin of the floppy, I have forgoten its logic state but it is
simple enough to figure out. Also the easiest way to set the step rate is to
install Tos 2.06 and just use a Hd cookie to tell the system that it is
present. That way you can format from the desktop too....

Now, -that- is the interesting part. The crucial point that interests me is the DRAM controller with refresh, address (de)multiplexing, etc. Chip-select decoding for the new RAM range should be quite straightforward and it probably doesn't matter much whether we talk about 4, 8 or even more MBytes of alternate RAM (AFAIK all space up to $DFFFFF is free for RAM which makes a total of 14MB, and maybe even the $E00000 to EFFFFF range for TOS ROMs might be used for RAM- what would GLUE say about that?).

An additional essential component is of course TOS2.06 for handling alternate RAM, but installing it into ROMs has already been documented, though it might be nice to use part of the same RAM address decoder to handle that too.

>Someone said that extra memory should not follow directly main 4 Mb as ST
>might try to put picture there.
>What about having those 8 Mb directly following main 4 Mb but with special

This is a nice idea! So when a little auto-folder program that declares alternate RAM is activated, screen allocation would be already finished, and the program would first enable access to alternate RAM, and then call the requred TOS function(s).

> Detectin write to sreen start address register might be good trigger for that...
>Just a thought...

Or, maybe easier, exploit one of the the unused output signals from the MIDI or keyboard ACIAs, or from the sound chip...

On the other hand... it has occured to me several times that it would be SO convenient if ST had some simple memory-mapped latches (just 8 bits), the outputs of which could be used to switch on/off all those various CPU accelerators, overscan circuits, FPU chips, manually switched HD-floppy circuits, alternate RAMs, etc. etc. Maybe a "standard" address location for such a latch should be found somewhere in the gaps between used portions of the $F00000 to $FFFFFF range... it could be write-only (i.e. simple), and, say, a cookie might be used to duplicate the data stored there, so that software modifying the contents wouldn't mess anything...
just a thought, as you said...

Most probably YES (unless the new floppy drive is set to respond as
"drive 1" instead as "drive 0")- but your computer would not be able
to read old DD floppies anymore.

However, a circuit that switches 8/16MHz for the floppy controller can
consist of just one standard 74LSxxx chip mounted on a little board
positioned piggyback on top of WD1772.

And, in fact, there ARE some pitfalls:

* Steprate should, of course, be 6ms always, not just for formatting.

* YOU WON'T BE ABLE TO BOOT from your HD floppy unless there is a
boot-sector routine on the floppy that changes step rate immediately
```

to 6ms. There are utilities which produce such boot sectors. Otherwise you will have 1.5ms step rate which I doubt any drive can follow, and probably you would be able just to read the root directory, and other data which happen to be on the first track of the floppy.

* You may be unlucky that your particular WD1772 02-02 is one of those few that would not work on 16MHz;

* If it works, it may be unreliable, though it is not likely: "02-02" specification means that the chip has a wider operating temperature range, but it can overheat anyway, especially if it is fed 16MHz all the time (much better to do so only when there is a HD floppy in the drive).

* Some computers (STE and MSTE, I think?) do not produce "clean" 16MHz signal that can be loaded with additional gates, so it is much better to use separate 16MHz oscillator then.

* Some (newer) HD floppy drives do not have easily identifiable jumpers for configuring as drive 0/1, but instead one must hack (without knowing for sure that it is the correct thing to do) miniature solder pads if any are visible on the drive's PCB.

>
>640x400, but everything will be 50% faster so your monitor might not like
>it.

What type of osc. did you use? I pulled the "32mhz in" pin out the
socket on the shifter and put 50mhz TTL straight into it, but nothing
happened as the floppy didn't spin up. Maybe 50Mhz is too much :) I
suppose you're using crystals as TTL osc can't be PLL'd to the
PAL/NTSC clock easily. I want to do this to an STE....

Problem is my VGA monitor won't work with an adaptor I have for a
Tatung monochrome monitor. I'll need to sort that out, but havn't the
time to look into it.

I took the 40 and 48MHz TTL oscillators from my old Nemesis.

> socket on the shifter and put 50mhz TTL straight into it, but nothing
> happened as the floppy didn't spin up. Maybe 50Mhz is too much :) I

I've now installed the 48Mhz oscillator, and there are indeed serious
problems when booting (black screen, no disk activity at all). When it
finally boots it works fine. I'll install a switcher and switch from 32 to
48MHz in the autofolder, that should cure this problem.

I'm using a 74HC00 for this:

```
                40MHz ---+---+
             +---+---+   |  |o--+
  select --+-+   |  |o---+--+   |
           | +---+---+          +---+
           |                    |  |o--- 32/40
           |                    +---+
           +-------------+--+   |
                         |  |o--+
                32MHz ---+--+
```

This circuit has previously worked fine in my Falcon and TT.

> Also: Lacescan uses the keyboard ACIA for switching. Maybe it would be
> good to remain compatible with that- i.e. not use the same signal for

Yes, good idea. It's just as easy to use the midi ACIA.

> that one might get about 800x500 b/w resolution with 40MHz clock.

Yes, that should be possible. I believe Peter Rottengatter use something
like this on his ST. I haven't been able to find any information on it
though.

Hi Marc-Ant�n

>> Today I successfully accelerated my Stacy to 10MHz :-)

>This sounds nice, perhaps I should more turborize my PAKed STacy with
>this solution.:)

Respect dude.

50mhz i believe is the limit before problems with the serial ports crop
up, some are stable, others are total shitte, there's no in between.
Karl Brandt used to run his PAK at 50Mhz but got constant prob's with his
serial port, must have a play someday, I think its time i bought a 50mhz
can. :-)

48MHz now works fine on my STacy :-) Everything is 50% faster, this makes an incredible difference. I'm just hoping that my ADSpeed16 can handle it, I'm going to move it from my 1040 to the Stacy in a few days.

some TTLs
> and HCTs, and I am contemplating how to install it mechanically
(probably in

I've just used two small pieces of Veroboard, one for the 32MHz and 4024, and one for the 48MHz and 7400. I could have put all of it on one board, but I wanted some flexibility with the speeder (after all, this is just an experiment and I don't know for sure how/if it will work in advance) by isolating it from the clock patch.

The boards and wires are fixed to the motherboard with hotglue. I'll take some pictures if I can get my webcam working again.

> a socket on top of the nearby Shifter), so I am quite interested in
> your progress :)

I'm not going to do anything with the shifter, so I'm afraid I can't help you there. But I've been told that C't had a similar project which fixed the sync-problems, I have the C't CD-ROMs up to 1995 but it wasn't in any of them. Perhaps Falke Verlag can help you.

The Stacy's LCD screen and controller works fine at 12MHz, but since the update frequency now is 50% higher, the screen fades a bit compared to normal. I don't think there's anything I can do about that, I don't have the schematics for the Stacy so I don't know if I can clock the LCD controller at 8MHz regardless of bus-speed. I don't even know the pin-out of the controller.

Hi Michael,

sorry to labour a point, but I thought that you project worked for/with
Milan-Computersystems and that you would have some knowledge of the
authority behind their news at:

www.milan-computer.com/de/news/news42.html

I will have to try and contact Milan more direct and also atos. As I
said before some-one's wrong here.

Bob King.

Hi

I've been thinking about this for a while now and have finally come up
with some good docs.
I've been thinking about getting 4 IDE drives on one bus. Seeing as
all the hard stuff is done for you in the IDE controller as found on
the Falcon and quite a few STs now, it seemed a simple solution of
switching banks of twos.

So acidently while looking for a VGA adaptor
schematics I found some article on an Amiga hack site for doing
exactly this. Basically it's very simple, ie 2 diodes for the IRQ and
and few wires switched over. These wires are the CS select wires, and
a couple of others.

What I need to know before I make an IDE cable with these
modifications is, will HDDriver pick up the second chain? I know

HDDriver can for machines such as the Milan (which has two ports on the mobo IIRC) but would it really work. Uwe, do you know about this?

Anyone interested can get the doc's I picked up, and a more simple text translation of the pinouts. (pic's are in IFF format, can convert though)

Thanks for your time.

Check out Chips 'n' Chips. Has some stuff about the Stacy's hardware, but I can't get any info about the LCD Controller. All I have is the part number.

Yes my stfm did boot once, IIRC, but I coulndn't see much on a TV!

I really need to get this VGA adaptor working. Anyone have any ideas?
The plug is wired up with all VGA's RGB connected to monochrome out
and Vsync and Hsync connected to each other Ideas?

> and Vsync and Hsync connected to each other Ideas?

VGA has separate syncs. You should connect it like this:

VGA	Atari
1 Red	mono in
2 Green	mono in
3 Blue	mono in
4,5,6,7,8,10,11 Gnd	gnd and mono detect
13 Hsync	hsync
14 Vsync	vsync

As you see you can get away with only four wires from the VGA connector to the Atari 13 pin DIN connector.

```

For actual switching it is fine but the point is: when does SELECT change state. Consider the following waveforms relevant to the above circuit (propagation delays through gates ignored):

```
32MHz  |�����|_____|�����|_____|�����|_____|�����|_____|�����|____

40MHz  _|����|____|����|____|����|____|����|____|����|____|����|__

SELECT ������������������������������|_____________________________

32/40  |�����|_____|�����|_____|�����||����|____|����|____|����|__

                                     ^
                                     |
                                     this must not happen!
```

As the initial phase of the 32MHz and the 40MHz clocks is completely arbitrary, the switch you describe may work 100 times and then on the 101st switching it may produce a short spike that may freeze the CPU. Now, I did not try this personally (yet) but all the articles on the "16MHz hack" (i.e. speeding just the CPU from 8 to 16MHz) warn of this situation and utilize a 74F74 triggered by a clock's rising edge- look at the schematics for those. Your situation is even more complicated, because in the "16MHz hack" the two clocks are synchronized as they both come from the same origin, while yours do not, so I think that even the 74F74 can not be just applied like that.

```
>This circuit has previously worked fine in my Falcon and TT.
```

If this is all there is, I am surprised if it works always.

>> Also: Lacescan uses the keyboard ACIA for switching. Maybe it would be
>> good to remain compatible with that- i.e. not use the same signal for
>> a different purpose.
>
>Yes, good idea. It's just as easy to use the midi ACIA.

There is an insanity on PCB design in some Ataris (don't know about STacies)
so that pin 5 of both ACIAs (that's probably the signal you would like to
use) are connected togeher, which serves absolutely no purpose and makes
a sort of short-circuit if the outputs of the two chips are in opposite
states. The PCB trace connecting them must be cut (see R.Andersson's
documentation on installing Lacescan).

>> What about the 4MHz that goes from the MMU to the MFP?
>
>Haven't patched that. What does this affect?

That's what I would like to know, too :) Maybe the 200Hz timer?
Or something about the video? Ronald Andersson's documentation
on Lacescan says briefly that MFP is involved in generating the
interrupt for the horizontal blanking, but there is more to know,
obviously.

>I haven't tested the serial port yet, but AFAICS it has a separate clock.

I think so, the serial port should be unaffected, as far as I can see.

>> picture on the SM124- does it seem out of sync, or what? Would feeding
>
>It's out of sync.
>
>> 4MHz to the MFP maybe help in this- MFP has some part in generating the
>> picture (DE goes in and MFPINT goes out) but it is not clear to me.
>
>I don't know, but I don't think this will help.

It may be interesting to see if applying the 4MHz would do something good
at least for the horizontal sync. I have a feeling that the vertical
sync may be easier to deal with in the SM124 monitor. But I really do not
know whether this input to the MFP should be in phase with the rest of
the system or can it be independent.

>48MHz now works fine on my STacy :-) Everything is 50% faster, this
>makes an incredible difference. I'm just hoping that my ADSpeed16 can
>handle it, I'm going to move it from my 1040 to the Stacy in a few days.

So, if I understand correctly, you would combine the two hardware patches
and have the whole machine sped-up to 12MHz and the CPU to double of
that (24MHz), right? As they say that speeding just the CPU gives a speed

increase to about 120%, the overall gain would be about 150% * 120% = 180% That would be nice, indeed. I am just worried that, at this speed, the circuitry that generates DTACK (in th GLUE, I think) may be too slow, (as someone pointed here a while ago) and may mess-up read or write cycles.

Btw. do you have a hard disk connected to this STacy? does it work OK still?

>> a socket on top of the nearby Shifter), so I am quite interested in
>> your progress :)
>
>I'm not going to do anything with the shifter, so I'm afraid I can't
>help you there.

Oh, but I don't want to do anything with the Shifter, either. That just seems a convenient place to locate a small board, with the new oscillator, the divider, etc. because (in the MegaST) the original clock is nearby and its signal goes only into the Shifter.

Oh, but if you did just that it is definitely not good: you have to feed the floppy controller a proper 8MHz (or maybe 16 MHz if you use a HD floppy). The floppy would not work otherwise. And if you don't feed the ACIAs with their proper clock you won't be able to use the keyboard.

>I suppose you're using crystals as TTL osc can't be PLL'd to the
>PAL/NTSC clock easily. I want to do this to an STE....

Maybe it's not relevant for the STacy. At least on MegaST here which has
the colour output as RGB only and so, as far as I know, has nothing to do
with PAL encoding, nothing seems to tamper with the frequency of the 32MHz
clock- it just goes straight into shifter.

For your Mac, go to http://www.wildbits.com/rescue/

and download Disk Rescue v 3 beta. You can register it later if you like
it ($39). By all accounts, it will discover everything on your hd, but
will not alter or destroy anything on it (unlike certain other apps...)

(Don't get distracted by the BeOS pages!)

So don't despair :)
Charles.

All true, but even without any patches (i.e. just replacing the master
clock and nothing else) the ST should boot. The floppy will still work,
but you'll just get read errors as it can't recognise the format.

Yes the Dtack thing is a problem but I think you can solve this by only switching to turbo when DTACK, AS and BGACK are high IIRC. Use a high speed AND gate. Credit to Michael Schwingen.

Farnell are flogging Hitachi 68000H10 for about 15ukp, so I may get one of those, clock it to 32mhz or something. 68pin PLCC only, sorry for people with STs! (unless you buy a DIP to PLCC convertor!)

BTW Djordje: I may think about making that memory upgrade using two 4mb SRAM chips (512*8bit). Should be simple, but I'm worried about the Glue giving a bus error signal to the CPU. On some dodgy schematics I found, they cut the higher address lines to the glue.

I did not follow the whole tread but:
I looked in an old cupboard and found:

a design from Richard Lucassen dated jan. 1993 for connecting an ST
to SVGA. Monochrome detect goes to ground. This means 'color' or
'b/w'?
Used are chips 4049, 4528 and 4040.
H-sync and V-sync go in, are gated, clocked and given to connections
to SubD-15 pins 13 and 14. Video in walks through to pin 1,2,3
persons interested can ask for a scan of the schematics

Met vriendelijke groet,
Ronald van der Kamp

Looking in an old cupboard I found two Atari folders (paper).

1. Atari System V UNIX implemetation for Atari TT
..Atari implementation od AT&T Unix System V Rel. 4.0 with X Window
11.4 and OSF/Motif 1.1
. virtual filesystem VFS, Device Driver interface DDI
.GNU C++, Symbolic S5 debugger, NFS, RFS, BSD connections

2. Atari ST Computer
X/ST/WINDOW

Atari ST as X Windows terminal (also available for TT and ATW!)
based on X/ST/multi (tasking). Network Ethernet and TCP/IP are used.
Can do Telnet and FTP.

Both are in Dutch.

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

Ah, I see... so the switching to "turbo" is delayed until the previous DTACK is finished. OK.

>Farnell are flogging Hitachi 68000H10 for about 15ukp, so I may get
>one of those, clock it to 32mhz or something.

Indeed it seems to be quite convenient for the two-way speedup that we talk about (bus to 12MHz and CPU to twice that). I don't think that speeding the CPU further will have any significant effect. And the schematics to accelerate the CPU to twice the bus speed are already available, so one has a bit less thinking to do.

>BTW Djordje: I may think about making that memory upgrade using two
>4mb SRAM chips (512*8bit). Should be simple, but I'm worried about
>the Glue giving a bus error signal to the CPU. On some dodgy schematics
>I found, they cut the higher address lines to the glue.

It should be quite simple- but around here big SRAMs are rather expensive- is that the reason why you contemplate only 1MB of RAM upgrade? It seems to me that stuffing there all the resident programs that one may use, e.g. NVDI, NAES or Geneva, maybe Mint, alternate desktop, etc would take a bit over 2MB- if that is to be the main purpose of the upgrade.

Regarding bus error: I think that I saw the schematics that you talk about, and they indeed made the things quite complicated. And I remember reading somewhere else that giving bus error depends on the make of the Glue chip: some chips just "fold over" gracefully and regard requests to higher RAM addresses the same as the lower 4MB. Other Glue chips, notably those produced by IMP, do not behave good at all- and give bus errors. It would probably be wise to make one's own DTACK response when contacting the alternate RAM and not to rely on the unknown roperties of the Glue. Though Glue would probably still make bus error if it is of the wrong kind :(

Btw. do you have some datasheets on those SRAM chips? I am interested in what are the supply voltage limits and current consumption when the chip is in the passive state.

Cu.

Exactly.  I just think 50mhz is pushing it, so I'll get some 40 or
48mhz TTL's soon.

Dam.  Is it simply an address that was poke'd to send the IDE
controller on the mobo to the second IDE bus?

Yes, I'm aware of this problem...

>>This circuit has previously worked fine in my Falcon and TT.

> If this is all there is, I am surprised if it works always.

...however, it occurs extremely rarely, so I really don't care. It's not
really difficult to use a latch or something similar to avoid it
completely, but it's more work ;-)

Anyway, it turns out that the 74HCxx's I have are too slow for the 48MHz
clock (AFAICS there's no reason for that, but it only works with the 40MHz
clock...), so I'm using a simple relay instead.

>>Yes, good idea. It's just as easy to use the midi ACIA.

> There is an insanity on PCB design in some Ataris (don't know about STacies)
> so that pin 5 of both ACIAs (that's probably the signal you would like to

I'm aware of this. I haven't checked this on the Stacy yet, as I'm only
using one ACIA anyway.

>>> What about the 4MHz that goes from the MMU to the MFP?
>>
>>Haven't patched that. What does this affect?

> That's what I would like to know, too :) Maybe the 200Hz timer?

I'll try to patch it and see what happens.

> Or something about the video? Ronald Andersson's documentation
> on Lacescan says briefly that MFP is involved in generating the

I believed the GLUE generated both hsync, vsync and DE, and that the MFP
only generated the interrupts. I'm not sure about this though.

> sync may be easier to deal with in the SM124 monitor. But I really do not

This is easy to test, I'll do it tonight.

> So, if I understand correctly, you would combine the two hardware patches
> and have the whole machine sped-up to 12MHz and the CPU to double of

Correct.

> that (24MHz), right? As they say that speeding just the CPU gives a speed
> increase to about 120%, the overall gain would be about 150% * 120% = 180%

The ADSpeed16 has a 16Kb cache, so the gain is more than that, almost 100%
in some situations. It can also access the ROM at full speed, so if it
works I'm going to burn MagiC in some fast EPROMs and save some memory as
well :-) The IDE-interface has TOS 2.06 so booting TOS won't be a problem,
just add another switch.

> That would be nice, indeed. I am just worried that, at this speed, the
> circuitry that generates DTACK (in th GLUE, I think) may be too slow,
> (as someone pointed here a while ago) and may mess-up read or write
> cycles.

This doesn't apply to the ADSpeed, as it never access the bus at 2x speed
anyway (except the ROM, but the GLUE isn't involved here).

> Btw. do you have a hard disk connected to this STacy? does it work OK still?

Yes, it works fine in both 10 and 12MHz.

Well that's true, but I'm trying to get just a picture at this moment!
I've checked my adaptor (that is a proper made one) and it's wired
exactly how Jo said, as I also assumed it would be. The VGA works
fine on a PC, the ST works fine on an SM144, and the adaptor works
fine also on a B&W Tatung monitor, so I really can't see why it won't
work.

>is that the reason why you contemplate only 1MB of RAM upgrade?

I've decided to go the full 8mb I think. A 4mb SRAM costs 16ukp which is 8bit. This will wire striaght onto the address lines as I think they have 22 bit address lines, wire these straight on the the bus, pin to pin with the CPU's 24 bit addr bus. Last address line 23 and 24 determine which 4mb slot to use. I'm taking it from the perspective of the CPU splitting it's address range into 4 equal size 4mb chunks.

23	24		
0	0	0-4mb slot	<Slow system ram>
1	0	4-8mb slot	<Fast ram>
0	1	8-12mb slot	<Fast ram>
1	1	12-16mb slot	<memory mapped devices>

Remember some of the 4mb SRAMs, if you pay a few more ukp you can get 12ns parts, or to you and me, 64mhz operation! Link that with a CPU going at 32mhz with NVDI malloc'ed to fastram and it'll certainly be very fast. I would be the proud owner of a Matrix card that I was going to link upto this accelerator deisn, but the guy David Williams has failed to send me the card or my hard earned cash back.

>Regarding bus error: I think that I saw the schematics that you talk

I really am not sure what to do here. Maybe the Glue does the below when something accesses the "special" 4-12mb range.
"You can assert /BERR instead of /DTACK, in which case you indicate the CPU that the address it wants to access is not valid. The CPU then aborts the cycle and takes the bus error exception"

When you access an area like the 4-12mb section you get 2 bombs signaling a bus error. Something is producing the /BERR , otherwise the CPU would sit there waiting for /DTACK to be signalled by a device that isn't there.

>Btw. do you have some datasheets on those SRAM chips? I am interested in
>what are the supply voltage limits and current consumption when the chip
>is in the passive state.

Nope not really, but If you need some real simple info about SRAMs there is a little on graham knotts page, but can't remember the site. Very good though, I suggest anyone to check this page out.

Not sure but lot's of old software is at chuck away prices.

HTML2TXT will convert to ASCII.  GDOS/NVDI will be needed to print
from the Crystal Atari Browser.  GDOS is free.

You'll need Mario's convertor to use a serial PC mouse, or plug it in
the serial (modem) port ansd use software drivers.

Perhaps, but this one works fine on both my old 14" TVM and the not-so-old Targa 17".

Or take a look at the NetBSD/Atari FAQ, it describes how to convert a regular serial mouse to an Atari compatible mouse. I haven't tested it yet, but I have a very cheap A4tech mouse here that I'm going to modify when I get some spare time.

Tidying up the wiring solved the boot-problem, it now boots every time I power it up. However, the keyboard doesn't always work, but a reset cures this every time. I don't know why this happens in 12MHz and not 10MHz.

OK, I tried it but couldn't notice any difference. Everything works as before.

Right now I'm trying to figure out how the Shadow-chip works, perhaps it's possible to always run it at 8MHz, thus solving the problem with the high refresh-rate on the LCD screen.

The proportions would be 0.3, 0.59, 0.11 R G B respectivley.

This poses an interesting point, where is the weighting taken care of in the ST system?.

In case of the Milan it's a little bit more, but essentially there are
additional port addresses that have to be supported.

There's a freeware program called HTML2TXT that will convert web pages to ASCII, if it's a simple HTML file without frames etc. Alternatively you could just load it into a text editor and do a search for <*> and replace with nothing. Note you can't uses 1WP for this, as it only has single character wild-cards (^H) whereas you need an any-number-of-characters (*) wild-card capability. Everest or QED and most other ASCII editors allow this, and should run on a 1MB machine.

If you had more memory you could print from CAB directly, but you need at least 2 MB for this program to run.

If it's a PC mouse, then perhaps an adaptor from Mario in New Zealand would do, though that usually has a 15-pin input, I think. This must be a really old one! But there are quite a few switchable Atari/Amiga mice about. If you can't find one, the best thing is to try the $5 mouse - it will hardly break the bank!

Regards, /Peter/

No. But I don't think this is the problem, it's more likely that there are
problems with the initialization of the ACIA(s) at power-up.

It was corrupted, but I found it at Vezz' hardware site instead. However,
this is version 3.x, I'm still looking for 6.55.

>clock...), so I'm using a simple relay instead.

They should work, indeed. Maybe the input capacitances are just a bit
too high for the clock output? Or maybe yoyu should try 74HCTxx; although
marginally slower, these chips have logic levels slightly different

than 74HCTxx, so that they are "TTL compatible"- that's what the "T" in HCT stands for- just reminding, as you probably know all this...

>>>> What about the 4MHz that goes from the MMU to the MFP?

>> That's what I would like to know, too :) Maybe the 200Hz timer?
>This is easy to test, I'll do it tonight.
>
>OK, I tried it but couldn't notice any difference. Everything works as
>before.

Not even on the monitor (i.e. SM124) output? That's sad news :(I hoped that it would have some effect. I suppose, as I only have a SM124, that I will have to try to generate syncs at the correct frequencies by a suitable circuit, and declare to the computer that the syncs are external...

What surprises me is that you could not get the colour output either. At 40MHz clock vertical frequency should have been 62.5Hz and I supposed that a good TV with a RGB (on SCART) input could lock to it- after all there are those small programs that raise the vertical to 60Hz and the TVs can handle it.

Btw. it has often been mentioned here that newer colour monitors can't sync so low as the ST video output needs. Maybe by applying a patch like yours to a ST, and by running a "60Hz" program on top of it it would be possible to enter the locking range of newer monitors...

Anyway, it seems that a patch like the one you made may well become a "standard" and quite easy upgrade for STacies, siginificantly upgrading their performance. Good :) I wish I had a STacy too...

>> That would be nice, indeed. I am just worried that, at this speed, the
>> circuitry that generates DTACK (in th GLUE, I think) may be too slow,
>> (as someone pointed here a while ago) and may mess-up read or write
>
>This doesn't apply to the ADSpeed, as it never access the bus at 2x speed
>anyway (except the ROM, but the GLUE isn't involved here).

As I understand it, it doesn't have to- the DTACK may linger too long from a previous bus access, so the CPU, going fast with its internal cycles through a next instruction, gets a false idea that a new access is already finished before it's even started.

Ooops! it seems I misunderstood! I thought you were talkina about
4MBIT chips and you were talking about 4MBYTE chips. Frankly, I didn't
know they have started making SRAM chips that big- I guess I am behind
the times a little bit here :)

```

But MC68K has only A1 to A23, you made a little lapse here. And
of course you will have to make a proper address decoder (like the
74HCT688 or whatever) for the "chip select" of the new RAMs, so that they
do not get activated when the memory-mapped-devices range is addressed.

AFAIK there is a sort of counter/timer in Glue which creates /BERR if /DTACK
is not generated in a decent time after /AS. But you can test
whether your particular Glue chip is OK: patch some simple TTL
circuit that decodes some address range in the 4-12MB area, and return
its output through an open-collector gate as /DTACK. Then try to read
something from this area. It does not matter what data you get, because
there is no RAM there yet, but just whether you get it without /BERR.

Yep sorry, I'm one up. I took the address lines as 1 to 24, whereas
it should be written correctly as 0 to 23. But the theory is right on
the above. I've put the "proper" numbers in brackets. Address
decoder will be very simple as you can see. When I assemble this GAL
programmer I can burn patches into it as I go along.

I think 4mb SRAMs are about the highest they go, without spending HUGE
amounts of cash. I really can not be bothered to use DRAMs.

That's a really cool idea Djordje! I have some ORs/ANDs kicking
around, so I'll get this mounted on some breadboard at the weekend,
with a small signal trany for the /DTACK. I'll report back, thanks
for the info about the way /BERR is made.

chapelie.rma.ac.be without a doubt.

>Is there "abandonware" for Atari? (with original, not ripped files)

Cypress and Scripter V5 (both WP) come to mind, GTLook (Epson scanner driver) for another - there are more but these are the only ones I can remember.

> What program can print (on Star LC 24-10) HTML files on Atari 1MB ST?

Your best bet is probably to use an HTML-TXT file converter, you'll find one on the chapelie server. You'll lose the formatting info though. If you use CAB and NVDI you can print from CAB?

It may have something to do with the ACIA's needed a syncronous
transfer between it and the CPU.  Have you tried Midi?

Hi to both of you (Uwe already knows this)

If running Naes one can change the language config and HDDriver picks
this up and runs in english or german respectivaly.

Cheer's J�rgen

Hi Jorgen,

I have a confession, and I know Katherine Ellis et al, will hate me for
this, but I have foresworn MINT/NAES for MagicMilan. Mainly because I
can't stop messing about with the auto folder contents and other mint
preciuos bits and totally buggered up my original Milan MINT/NAES system.
The new Magic system, does seem to give me e few more errors, ie rows of
memory addresses etc, but it never crashes, just sails on through. It's
a lot faster too. Big regret is the loss of DA's LayoutTC which just
refuses to load anything but the smallest DIP. Never mind I can always
go back to the Falcon for my DTP work.

Bob King.

Hi Bob

That's ok by me, I figure it's mostly a matter of taste and how much one like's to get in to the nitty gritty. Of course, more control over configuration means more power, but if one doesn't need it, it's not worth the hassle. Me, I hardly ever have a systemcrasch, it just give an error and finish the offending program. Like I said, personal taste and what you feel comfortable with.

I have an old Commodore 64 that did that. It worked when I packed it away 14 years ago but the other day when I tested it, it won't work. It will power up but instead of the normal blue screen, I get a black screen. It wasn't no good anyway, the sound chip and the microprocessor were on their way out and half the games wouldn't work.

My other C-64 I bought in 1989 still works and an old grey case C-64 still works.

I asked a guy I work with who knows about electronics and asked him what would make an electronic device just go bad despite being stored in a dry location. He said that after so many years the capacitors can leak. So it may be as simple as replacing a few capacitors.

Any ideas what a caps lock key does?!!?

Yes there are packet radio progs for connecting a packet terminal thingy to the RS232 (serial) port. IIRC there is one on the chapelie server. I may be wrong though, and it's probably a few years old, but still very usable.

Yes, but I feel it's more likely to be the chips coming unseated or
simply the connectors oxidising.  Metal goes bad if kept in
coldish/dampish conditions.  You state that it was kept dry though,
but solder is even more likely to go bad, so solder joints may have
gone bad, like a dry joint I suppose.

Hi Steve, again,

I have tried your suggestion, of installing HDDriver with -e parameter.
Unfortunately it does not seem to work on the Milan and Jinnee. However,
although holding down ALT whilst clicking on HDDriver, merely displays
HDDriver in the viewer (as you know, ALT is reserved by Jinnee for this
function), by holding down ALT and Ctrl whilst clicking, this reserve
use is overriden and the english boot up trick works.
Thanks again for the tip, I'm sure it works in other OS/Desktops.

Bob King.

A bit of digging with a binary editor in MAGIC.RAM also acheives this.

Look around for "Atari NOS", old versions worked for radio packet, I think it should also be ok with the actual release, tought I am not able to test as I have no radio stuff. Try in the download section of my home page.

Steve Sweet skrev:

>Hi Iggy

Hello, Steve.

>>>Ok, your right, i'l only steal 10 year old cars and jewelery in future,
>>>do you have any 10 year old money?.

>>As long as they are abandoned, I won't classify that as stealing.

>I hope you dont live in my neighbourhood, your standards are about as low
>as whale-shit.

My standards are so low, yes. I'm never afraid of dirtying my hands while
digging around dumpsters. I've rescued a lot of equipment out of them.
Similarly, if I find a monitor abandoned in an alley, it's coming home with
me.

>How would you define abandonded?, probably to suit your need for the item
>concerned. Anyway, being abandoned doesnt mean it is ownerless, it just
>means the owner doesnt want responsibilty for the problems its causing.

Please don't make such assumptions about me or my moral fibre. I buy my
software, I just don't go around paying for goods I've found in dumpsters.

>That scenario doesnt apply to TOS, its not abandoned, its just not being
>developed, would you consider a house that dont get rebuilt every year
>abandonded!!

No-one lives in the TOS house. We've been knocking on the door and ringing the bell, but the owners went on a vacation five years ago and now the house has dilapidated.

>>Please lay off this cars/jewelry analogy, it doesn't work with digital
>>media.

>Theft is theft you moron, of course it works.

Have I called you a moron, or perhaps insulted your mother? Behave like a gentleman, please.

If I drive off with your car, you will never see it again. You will have to walk to work every morning from now on. Could you claim that this would be the case if I used a copied TOS?

>But if it dont work for you, can you send me all your software to save me
>the trip to break in for it.

I'm not advocating theft of original tangible assets. I would never give away my ST, but if you ask nicely, I'll copy some software for you. No-one cares about it, anyway. No-one. Absolutely no-one. You, Steve Sweet, are no-one. You don't partake in the transaction, and will not lose a penny, nor your TOS, and neither will anyone else.

>>This guy has already got a legal TOS. He just doesn't like the language
>>it's in. Are you to deny him the pleasure of running an English TOS?

>No, i'l not attempt to deprive him of anything, he's welcome to buy an
>OS, like i had to, and many others with morals higher than yours.

Of course he could buy an OS. A still developed OS, such as MagiC or N.AES. In that case, he is supporting further development, whereas paying for TOS 1.x or 2.x will go to nothing else than perhaps a meal at Burger King for the lucky guy who'd managed to sell it.
I'd rather see the tens of pounds wasted on an old TOS put to better use buying still supported software.

Besides, Apple are giving away System 7.5 and earlier on their website. AmigaOS 3.0 is available on Amiga Format cover disks, legally. The TOS versions which would be of interest in this case would be even older than these OSes. Why would the Atari user pay a premium for the pleasure of using a ten-year-old OS in English instead of the same ten-year-old OS in German? Because he's an Atari user and deserves it? Because he likes riding high moral horses into nowhere? Get serious, Steve, the enemy isn't someone copying TOS 1.6, it's those copying MagiC.

Every TV with Scart (save for the French ones, perhaps) is PAL compatible, but that is irrelevant if you're going to use RGB. RGB compatibility is required for good quality, yes, unless you're willing to settle for composite video.

Ah yes. The Amiga model numbers were 1438 (avoid it, it's got no digital
memory despite being sold to users who switch screenmodes all day), 1564 and
1768, IIRC. The first two numbers specify the screen size in inches.

Yes it does, but you have to do it at the right moment. I click on the HDDriver program and wait a split second and then hit the ALT key. It takes a few tries before it works, but it does work under Jinnee. You cannot be holding down the ALT when you click on the program. Funny this happens under Magic and N.AES, but under Geneva the program automatically comes up in English.

Hi Bob,

I have a SCSI interface in my Milan, I use it for my Umax scanner but
I also connect my Syquest EZ Flyer occasionally if I want to transfer
any large files to my ST's boot disk (an EZ flyer cartridge).

It works a treat, (thanks Michael). I haven't even noticed the reported
problem with it clashing with the MilanBlaster. (What is this problem,
Michael ?)

I wrote a short article for My Atari online magazine about my experiences
of connecting a SCSI card to my Milan. (my only claim to fame ;-)

Now if only I could connect a SCSI/Firewire card...

```
Regards,

Peter

Sorry for late response.

I was hoping that I will be able to draw a nice schematics, but I'm in a hurry and already late with response to your letter for a few days.

So, instead of having schematics, you will have to settle with handwaving description for the present.

ST's shifter has nine colour outputs (3 for R,G and B output respectively) on pins 21-29 and monochrome output on pin 30. This means that each main colour can be output in one of 8 intensities/-from 0 to maximum.

Colour signals are grouped per colour, so pins 21-23 are for red, 24-26 are for green and 27-29 are for blue component. D/A conversion is performed with nearby resistors.

If you look closely, you will notice that 3 resistor values are repeated 3 times. There are 3K6, 7K5 and 15 K resistors for each colour. Each resistor is connected with one end to corresponding TTL output and other end is tied to other ends from other resistors in the group. Common connection of all three resistors go to the katode of small signal diode and then to th base of buffer transistor. All resistors have to be taken out from PCB and soldered to pins directly with other end of all resistors connected. Diode is soldered to common pont of all resistors and anode is wired to base of coresponding transistor.

In essence, this reflects vconnsections in PCB with the difference that all circuitry
is now far away from noisy data lines. Oh, yes, one have to cut connection on the base
of buffer transistor in the PCB, since this would otherwise still inject noise in the
signal.

Whole operation would be to use small piece of test PCB, solder in 2 groups of 20 pins
so that whole PCB can be inserted into old shifter socket and shifter chip should be
soldered on that test PCB adjacently.
Then, one should connect all pins between shifter chip and socket, except pins 21-30.
After that, one needs to solder on the test PCB three 74HCT32 (quad OR gates each).
Two of the gates should buffer mono out signal of the shifter (pin30). THen, each
colour output from shifter should be ORed with bufered mono output and connected to
corresponding socket pin. Mono out pin on the socket should have separately buffered
mono out from shifter. After that, one has to properly connect VCC and GND for each
74HCT32 and 100nf multilayer capacitor across power pins of each chip. Then, test PCB
can be inserted in the old shifter socket. Now we have colour output active in all
three resolutions.
After that all we have to do is to relocate those resistors to some safer place,
possibly on the test PCB along with shifter chip and those 3 TTLs.
I'll document everything more thoroughly if needed....

Regards,

Branko

Hi Peter,

yes I know of your article 'When Milan met SCSI', I have it in front of me now. I have looked on the web re CI_2520 cards and printed out data. Even if I could buy one, I understand that any driver has to matched with the Milan motherboard serial number, so I still have to find a source for the driver. Any comments?

I suppose you know that the EU flag is to fly over Downing Street, you can still see Phoney Blairs tongue marks.

Bob King.

Your version of HDDRIVER may simply be too old. See the README for
information about this option. If it's not listed in the README you
version doesn't support this option yet.

This simply depends on the languages settings environment, e. g. on the
cookies that deal with languages.

Do you mean cut the base of the trany from the board and pull it up
(physically)? It was a bit unclear.

So the above is only needed to connect an RGB monitor and run in high
res? (providing the monitor can sync up to 3xkhz)

>I'll document everything more thoroughly if needed....

I can understand it quite well. Thanks I may try the removing the
resistors bit, as I doubt I'll need to connect an rgb up to my ST.
BTW the schematics for an STfm say the resistors for the DAC are 1k,
2k and 3.9k but that won't make a difference I suppose and they're
still proportional.

Would it help to use high grade resistors with tolerance of say 0.5%
that are exactly 2 times the value of the last one i.e. 1k, 2k and 4k?

Any PCI card with a NCR 53C810A chip should work - these are quite common, you do not need the CI2520, that is just an example (another is the Asus SC200, although nonames are available cheaper and work as well).

The PCI bus arbiter hangs when SCSI transfers and sound DMA happen at the
same time, locking up the whole machine.

Hi Michael,

Yes I got the above from your earlier posting to me. It was just that it was the CI2520 which was specificaly mentioned by Peter in his very useful article in My Atari. It still leaves the obtaining of the driver. Is it a peculiar fussiness that you have to code match the card to the motherboard, or is it because there were several different boards, or what?

Bob King.

No. Its simply because my experience has shown that there are too many illegal copies otherwise.

Today I successfully accelerated my Stacy to 10MHz :-) I'm currently testing it, so far it looks very stable. This was a very simple modification:

1. Remove the original 32MHz oscillator and replace it with a 40MHz oscillator.
2. Cut pin 3 and 4 on the two ACIAs (6350) and feed these pins with a 500KHz clock.
3. Cut pin 18 on the floppy controller (1772-0x-0x) and feed it with a 8Mhz clock.

The 500KHz and 8MHz clocks can be generated by using the original 32MHz oscillator and a 74HC4024 (ripple counter).

This works very well on my Stacy, and everything is 25% faster. The Stacy's LCD controller works fine at this frequencey, but the shifter doesn't generate an image which works with TV's or my SM124 anymore. It does work with a SVGA, but the image is squashed.

It's also possible that I have to feed the YM with a 2MHz clock, I haven't tested this yet but the 74HC4024 generates 2MHz as well so this is not a problem.

I have a few more things to try out (e.g. I haven't tested the printer and modem ports yet, I have a 48MHz oscillator I'd like to try, will the ADSpeed16 work at 10/20MHz, will Mario's IDE interface work etc.), when this is done I'll upload a more detailed description to my homepage.

"AS SEEN ON NATIONAL T.V."

Thank you for your Time and Interest.
This is the letter you've been hearing about in the news lately.
Due to the popularity of this letter on the internet, a major nightly news program recently devoted an entire show to the investigation of the program, described below, to see if it really can make people money.

The show also investigated whether or not the program was legal. Their findings proved once and for all that there are, absolutely no laws prohibiting the participation in the program. This has helped to show people that this is a simple, harmless and fun way to make some extra money at home.

The results of this show have been truly remarkable. Since so many people are participating now, those involved are doing much better than ever before. Everyone makes more as more people try it out. It is very, very exciting to be a part of this plan. You will understand once you experience it.

HOW TO TURN SIX DOLLARS INTO THIRTY-SIX THOUSAND:

READING THIS COULD CHANGE YOUR LIFE! IT DOES WORK!

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well GUESS WHAT!?... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, WHY it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so incredibly easy!

Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage)

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works!

If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhearing to the instructions.

You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS 100% LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal. Mail the 6 envelopes to the following addresses:

#1)Mike Schude
893 S. roanoke
Gilbert, AZ 85296

#2)David Freeman
11045 Harbour Springs Circle
Boca Raton, Fl 33428

#3)Kevin Kniceley
4029 Minard Rd. N.W.
Dover, OH 44622

#4)Kevin Mitchell
800 IN Hwy 212 Lot K5N
Michigan City, IN 46360

#5)Brent Anderson
100 Currier Hall N331
Iowa City, IA 52242

#6)Adam Gittins
P.O. BOX 261112
Highlands Ranch, CO 80163-2611

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! You won't get very much unless you post like crazy. :)

This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!

FINAL NOTE: If you don't know how to post to the newsgroups, please read the below instructions, also check out http://freenews.maxbaud.net/ to find a good server to use. I also found a great way to send out to 40 million different people.
You can order 25 million e-mail addresses for $99 and 40 million for $149 by calling 215-552-8909, faxing (520) 447-8533 or writing to Valtech, 13 Summit Square Ctr, #151, Langhorne, PA, 19047.
This would be the easiest way to make big money fast. Use whatever methods you like, as long as you at least post to 200 newgroups.
Still there are even more ways to deliver the message. Faxing and

regular U.S. Mail are also options. In short, do everything in your power to get this message to as many folks as you can legally. Another good idea is to target multi-level marketing newsgroups and individuals, as these folks are familiar with how this statistical system works. Making one million dollars is absolutely not impossible. This system is statistically proven to work. ALL you have to do is follow the instructions.

See you at the bank! :)

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------

Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list. Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to.
Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Step 4 - Now the WHY part:
Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $625.00! OK, now here is the

fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will truly pay off in the form of thousands of dollars!

One more thing: This software, www.HITMAKER.com can help you to post to many, many (thousands) newsgroups. Helpful tools can be found at http://www.mygroove.com

Regards.

Here is something you may want to look into later (I had to do this when I had my AdSpeed, Larger HD & a Midex+ hooked up and if the floppy was accessed)

Quote:

Category 14, Topic 29
Message 56   Mon Apr 26, 1993

P.MCCANDLESS [plonker]   at 00:27 EDT

WARNING........ LONG POST!

Here is a solution, ending my miserable hard drive/power supply problems for my STacy. Have you wanted to replace your inadequate stock CONNER hard drive with a larger model? You may have found that there isn't enough power available from the stock power supply, and with goodies like GCR, the entire computer crashes and reboots.

WHY??...... The stock PHIHONG power supply's specifications are: 16.5V at 2.5 amps. I found by watching the oscilloscope during floppy and hard drive accesses that the external power supply can deliver EXACTLY 2.5 AMPS and NO MORE! If the load exceeds 2.500000 amps, it shuts down until the load has returned to under 2.5 amps.

Nothing seemed to help. I tried tweaking the 12 and 5V potentiometers on the internal power supply board, trying other hard drives, large filter capacitors on the 5 and 12 volt lines and trying non-ATARI floppy drives. No luck here....

THE SOLUTION!......was finally discovered when I realized that by improving the filtering and stability of the power supply, the transient current loads no longer exceeded the maximum supply ratings. Simply, de-solder the 5v line leading to the hard drive at the power/regulation board. Solder the input leg of a LM340K-5 (5v, 3amp positive-voltage regulator) to the 12v line. Solder the case (GND) to the GND terminals between the 12 and 5v lines on the power supply/regulation board. Solder the wire leading to the hard drive 5volt line to the output leg of the LM340K-5. This solution has been flawless, running an impressive 2 years now!

Living in Australia has it's disadvantages, so much hassle to just GET any
software, let alone resolve drama's with Titan which in my experiance wasn't
worth hassle.I will definaetly look into a newer version tho..

You could do that, but its not neccessary, besides, at this point I'm not sure if anything
else goes to base. It's much better to find the trace that goes from anode of diode to
transistor and to cut it on the transistors end.

<SNIP>

For operating multisync monitor through RGB you only need OR-ing of shifters colour outputs

with monoout.
Fiddling with resistors will get you better, noise free picture..

>

When writing that mail, I took a glance at ST520 mainboard, so my values are from
the
board.
One might use also smaller values. In theory, that could give you sharper picture,
provided
that
TTL outputs driving resistors would not yield too much.
Different values in schematics could have to do something with using worse
transistor with
lower gain...
If you are in a mood, try first with your values....

>
> Would it help to use high grade resistors with tolerance of say 0.5%
> that are exactly 2 times the value of the last one i.e. 1k, 2k and 4k?
>

Don't bother with it. You won't notice the difference. There are many more factors
than
only
resistance ratios when designing DAC...

Regards,

Branko

Hi Michael,

Understood,

However a new problem arises. From
http://www.milan-computer.com/de/news/news42.html, it seems that my
GT5000 scanner driver GTLook2 is not compatible with Milan SCSI cards.
If not, then it's debatable if it's worth getting a new scanner, new
driver, new SCSI board for things I can already do with my Falcon.

Any comment please.

Bob King.

Great model ! I'm looking for something less expensive, the Omni.net D
for example. It have neither the analog modem nor analog ports. I can
have it for arround 150 EUR. There is also the ELSA Microlink ISDN, at
arround 110 EUR, but I don't know if it will be as good as the ZyXEL.

Bye,
/Pascal/

Hi again Michael,

the puzzle gets deeper. Re my message above, the very comprehensive page
at:

http://www.mindrup.de/atos/news/news20000907-02.html

listing all the scanner drivers for the atari and compats. clearly lists
Milan I amongst the suitable hardware for GT Look II. Somethings
amiss!!! Any comments please.

Bob King.

Can you get a higher res, using the lacescan drivers. Does it come up
as 640*400 as default when you switch on?

>It's also possible that I have to feed the YM with a 2MHz clock, I haven't

>ADSpeed16 work at 10/20MHz, will Mario's IDE interface work etc.), when
>this is done I'll upload a more detailed description to my homepage.

I wanted to try and see if I could make my STfm with a 50mhz bus
running 12.5mhz CPU. Haven't tried it as I'm unsure what the video
will do. Would it boot up into 640*400, or some value around 960*600.
As for IDE I've always been thinking about accessing my IDE at more
than 8mhz. I do have a 50mhz TTL clock kicking around..... If I
could get hold of a decent high speed 68000 I could then use one of
those cheap 8/16 mhz switcher circuits (run by a GAL) to bump the CPU
up to 25mhz and the same with the IDE. My IDE interface can go up to
64mhz, so there's no problems there. UDMA/66.... :)

You may havie problems with the interupt for the HD though that is
conenected to the MFP.

Greetings
Trying to ID a hard drive I received with some other Atari items, not sure
what it is. Inside it says Quantum Prodrive ELS, and it's got SCSI ports.
Will this work with Atari? Anybody interested in this unit?
Thanks,
fcr

Not sure - I have neither GT-Look nor an Epson scanner, and I know of noone
who does, so I can't offer much insight here.

I looked in the discription of the Stichting ST PD-library (Dutch)
I found adisk with the following:
RTTY: for telex messages recieve and send
YARP: telex with possibility to send  CQ, RY en QBF messages.
PACKET:  special for data packet send/recieve.
QTHLOC: for QTH users.

So now you have some names to hunt for in the world.

Thanks, it might come in handy later on :-) I'm planning to replace the power-sucking Quantum with a small 2.5" driver though.

Lyndon Amsdon <bindon@madasafish.com> wrote:

> Can you get a higher res, using the lacescan drivers. Does it come up

Yes, using something like LaceScan would give higher resolutions. I assume you have to patch the driver for the new frequencies though.

> as 640*400 as default when you switch on?

It comes up as 640x400 (since both the syncs and videosignal is 25% faster), but the frequencies are all wrong. Multiply them by 1.25 and you have the new frequencies. My SM124 doesn't handle it, but my old SVGA does.

>>It's also possible that I have to feed the YM with a 2MHz clock, I haven't

> Playing tunes and they'll be all the wrong pitch.

I know, I just tried ;-) I'll patch it as soon as I've read my mail. I'm
also going to build a clock-switcher that will be controlled by the
keyboard-ACIA.

> I wanted to try and see if I could make my STfm with a 50mhz bus
> running 12.5mhz CPU. Haven't tried it as I'm unsure what the video
> will do. Would it boot up into 640*400, or some value around 960*600.

640x400, but everything will be 50% faster so your monitor might not like
it.

> As for IDE I've always been thinking about accessing my IDE at more
> than 8mhz. I do have a 50mhz TTL clock kicking around..... If I

I have an ADSpeed16 I hope will work at 24MHz, or atleast 20MHz. It can
access the ROM at full speed, so if you're making your own accelerator it
shouldn't be a problem to access the IDE at full speed as well.

What about the 4MHz that goes from the MMU to the MFP?

>This works very well on my Stacy, and everything is 25% faster. The

What exactly does you mean by squashed? Distorted or just smaller (horizontally, vertically, or both?). And what exactly happens to the picture on the SM124- does it seem out of sync, or what? Would feeding 4MHz to the MFP maybe help in this- MFP has some part in generating the picture (DE goes in and MFPINT goes out) but it is not clear to me.

I think that Lindon's inquiry about Lacescan circuit and driver is interesting- IF the sync rates can be kept to original values I suppose that one might get about 800x500 b/w resolution with 40MHz clock.

I am serously thinking of making a similar modification to my MegaST- have got the 40MHz (and 44MHz, to try even faster) oscilators and some TTLs and HCTs, and I am contemplating how to install it mechanically (probably in a socket on top of the nearby Shifter), so I am quite interested in your progress :)

be careful- as the 32MHz and 40MHz clocks are not synchronized you may
easily get glitches at the moment of switching that your computer wouldn't
like at all. I suppose that you will have to make a little circuit that will
delay the switching untill both clocks are approximately in phase.

Also: Lacescan uses the keyboard ACIA for switching. Maybe it would be
good to remain compatible with that- i.e. not use the same signal for
a different purpose.

>
>the maximum throughput of the ST's serial port is 38400 baud (i think)

It's 19200

>but it can be upgraded to 115200 baud so u could use a 56K modem

That will be 2*19200, 38400

A 33600 modem will be more than adequate - but a V90 modem might be handy if
there's any thought of changing platform.

I think so, but you need an ST between the printer and the PC. In other words not directly, but there is a program that enables an ST to be a print server.

IIRC, Derryck Croker has the program on his website somewhere (though I can't remember the name of the program).

http://www.cix.co.uk/~derryck

Cheers!

James

The SLM's, as I recall, we "brainless" printers. You had to use the ST's 68000 CPU to make it go at all. I think they also required the ST's memory as well...

If you were to find some way of making one work with a PC, you might as well call them... controllerless/memoryless printers... kinda like a PCI winmodem, but... a lot larger! :-)

Jared

Is it possible (and if, how must i connect the pins) to connect a EGA-monitor at my atari 1040 ST, so that i can play low resolution-games on it?

greetings,

Fred Jonkergouw

>
>I think so, but you need an ST between the printer and the PC. In other
>words not directly, but there is a program that enables an ST to be a
>print server.

Spot on James, it's to be found in the MISC section. Basically, you set the printer driver to use an HP printer at 300dpi and with output set to "File". Take the file to the ST and load it into the utility, which will convert the HP printer commands into ones which the SLM (there's no such printer as the 506) can understand.

It also supports data received over the serial port, so if the source can have printer output sent to the serial port...

No. EGA uses digital signals, whereas the Atari port only outputs analogue signals.

And requires a software patch, HSModem, to work reliably.

>>but it can be upgraded to 115200 baud so u could use a 56K modem
>
>That will be 2*19200, 38400

57600 is just about possible with an external clock source, HSModem and Magic. At that speed it's okay for file transfers between similarly equipped STs, but for connecting to the net would require processor acceleration.

>A 33600 modem will be more than adequate - but a V90 modem might be handy if
>there's any thought of changing platform.

Or if they upgrade to a Falcon, TT or clone, at a later date.

Regards,
  David Bolt

In uno strano messaggio del 11 Oct 00 xlator@cix.compulink.co.uk
(2:333/608.1) scrisse al povero All :
 x> Long file name and large partition support - DE can't handle either.
 x> With my 840 MB partitions DE gives negative numbers for sizes etc,
 x> crashes when you try to display the fragmentation map - so I certainly
 x> woudn't trust it for a defrag. Also HPO seems to give a 'cleaner'
 x> optimisation, although it hasn't got all the facilities that DE has.

There are at least two things I can't do on my "long name" partitions, but I
I really would: undelete and recover lost chains.

I really need those functions, undelete with DEDGE on such partitions creates
big problems, but can be done "by hand", putting back the first filename char
in the dir. Recovering lost chains is a big trouble.

So there is a third thing I would like: a disk editor, at least hexadecimal
like the old "disk doctor", I've never found one that works with big
partitions. Actually I'm connect the scsi chain to the PC and using a DOS
disk editor, btw you can't see logical partitions, and recovering lost chain
is still impossible, I would really need a guide in walking the FAT.

Any hint ? Is there anybody able to set norton disk editor or similar to
interpret that MagiC partitions ? I've tried various parameters for a virtual
disk unsuccesfullly.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

You can do this with DISKUS (German only). Although long filenames are
not explicitly supported operations like undeleting work. You only have
to rename the recovered file afterwards since the undelete will result
in a recovered file with a short name.

DISKUS supports Atari and DOS compatible partitions of any allowed size:

Hi David

>>>the maximum throughput of the ST's serial port is 38400 baud (i think)
>>
>>It's 19200
>
>And requires a software patch, HSModem, to work reliably.

You can assume that if you want to use the Atari ports in any state that you will need HSmodem in order to acheive correct operation.

My web site also hosts some German software that's been translated into English - look in the MISC area.

I also host DDP Translations, which is Peter West, Dennis Vermeire and myself. Everyone will have seen my sig. This group mostly concentrates on translating commercial software, so you'll find RSC files (and other files in some cases) on the DDP page. Recent work includes jinnee 2.5 (which System Solutions are nearly ready to sell to a discerning public) and JAY Groups, the Thing/Taskbar groups utility.

True, but doesn't do any harm in telling those who ask if an ST(E) can
be used on the net that it's required.

Regards,
  David Bolt

I use the 'Monitor' in Harlekin on my large partitions without problems, though you have to do it by hand.

> Actually I'm connect the scsi chain to the PC and using a DOS
>disk editor, btw you can't see logical partitions, and recovering lost chain
>is still impossible, I would really need a guide in walking the FAT.

There was an extensive series of articles on this in the old 'ST Club Newsletter', issues 18 - 23 back in 1988/89. But I am not sure those details of how to decode the FAT apply to 16-bit FATs found on large partitions.

Actually KNIFEST.PRG gives a display of the FAT and also works as a hex editor (though it has a slower search than Harlekin's). But don't trust its disk check functions - they don't work properly on large drives. Knife also has a means of rebuilding a file in memory or on disk, but again I don't know how well it works on large partitions; in any case it doesn't follow the cluster chain automatically, but (like the old Michtron Utilities) you have to decide whether the next sector displayed is part of the file. With text you have some chance of recognising this - with bins you don't.

Regards, /Peter/

Well, as the subject line would suggest, I need floppy cables for the ST.

I've got 3 520STs that I believe good, one floppy drive, but no floppy cables.

I've spent a fair bit of time searching electronics parts suppliers' catalogs (Digi-Key, Newark, and the like) for the connectors so I can manufacture my own cables without any success at all.

Does anybody have any suggestions on where I can go to get either connectors or cables?

Thanks.

Barry

Yes, I've done this myself.

> I have an ST video plug.

> What pinouts do I need for the monitor end ???

It depends on how you want to connect it. The easy way is to just use composite, then you don't need any pinout at all. If you want to use RGB you need the pinout for the RGB-connector on the 1084S, I believe you can find it on "The Hardware Book" (can't remember URL, do a search).

Beware that the 1084 doesn't have separate H- and V-syncs, so you need to create a composite sync from the syncs on the ST. I used two diodes IIRC (it's been many years since I did this), but if you have a ST with composite video (on pin 2) I believe you can use this as sync.

I don't know if LAPD still stock it but you used be able to get TOS 3.06 on a bootable floppy!

Hope this helps.

If not an eprom programmer can be used.

Why not upgrade both to TOS 2.06 it's worth the upgrade.

Tim

There are versions of TOS that come on disk. These were a way of trying
out the new version without the expense of fitting new ROM's.

>What pinouts do I need for the monitor end ???

Hiya

Yes you can, I use one. I can also get the cables for them, well the last time I looked I could.

There are also 2 models of 1084S's, I've got both but haven't checked to
see if the connections are the same yet!

```

Hi Barry,

Are we talking internal or external cables here. I take it you mean internal. The internal ones are 34way ribbon cable with an IDC female connector for the floppy drive and there is a crimp type connector soldered on the motherboard. The ribbon cable you can get easily, as you can either:

1) buy a length of 34way ribbon cable.
2) get some that is more than 34 way (ie 40 way IDE drive cable) and trim off the excess 6 wires.
3) hack apart a PC floppy drive cable

The connecters should be easily got as well, as they're standard floppy connectors. You'll need a crimp tool really though, but you can do it with a bench clamp. Getting the ribbon onto the motherboard's
connector is a sod, as you have to be careful to to push too hard as the motherboard will crack.

Hope that helps...

Hi all,

I know that this message probably belongs more to comp.sys.atari.st, but my Netscape crashes every time I try to access it.

My friend has a 1040 ST with TOS 2.06 & IDE and recently his machine has died. I have repaired it, but he can't access data on his hard disk now.

He's not worried about the disk (127 Mb Quantum), since those things are cheap, but he NEEDS to get to read some files (if nothing else) from it. Disk confirms its sanity when I try to look at it with SCSITOOLS Pro. I mean, program finds it, reports the right capacity and I can even do the non-destructive sector test. I didn't try to format or partition the drive since data on the disk is valuable.
IIRC program even recognises existing partition. But when I fire AHDI from floppy, I can't write new driver on the disk, since AHDI does not recognise it.
Disk was partitioned with Scsitools and driver was written with AHDI 6.something.

I can't use disk doctor to repair the disk since all of them require for the disk to be recognised by the TOS, otherwise one can't reach them.
Is there some low-level utility for fiddling with file system on the IDE disks through the IDE interface directly (without TOS) ?

TIA,

Brane

Carl,

You could open both machines to see if they both are using 6chip TOS. If they
both are using 6 chip TOS you could swap the chips. If you do this take note
of where you took chips out of and put them in the same socket on the other

ST. By this I mean each socket has a number next to it put the chips in the socket numbered the same as the socket they came from.

Don

Hello,

I have an Atari TT with the Original Internal 250meg SCSI harddrive that I can not access anymore.

I some how deleted the driver that was installed and cannot seem to find anything anywhere for my machine. I even tried HDDRIVER this will only detect the drive and refuses to install because some other piece of software

is installed. I get an error saying ."Ahhh, something like". 'Magic blah
blah you need
SCSI.DRV for Magic C or some rubbish.'

So I tried lookin for this and had no luck.

DISKUS can access such a drive as long as a SCSI Driver (like the one
from CBHD or HDDRIVER) is installed. Note, however, that you can only
access the partition physically, not logically, i. e. you won't have the
benefit of filesystem-based functions. But in order to repair the damage
it's most likely the best you can get.

Oops sorry. :)

External 14pin dins (plug and socket) can be got from Maplin in the UK
and you can use any good 14 or so way cable that is sheiled.

Is that what you need? Pinouts for the plugs are in the back of the
manual or quite easily located on the net.

Yup... and it works fine.
```

HP. Rutschmann wrote:
>
> Has anybody ever (except me) tried to hook up an ST on Ethernet?

Mega ST4, Mega ST2 and a F030... all together on an ethernet network
with two more Pentiums.
In the Mega STs I use a Riebl Card, for the F030 I use a pocket adaptor
(Genius LAN). The entire Atari configuration is STinG based.

> I want to share data like MIDI files, preferrably over TCP/IP or
> NetBEUI.

NetBEUI won't be possible. This is typically (simply "is") a Micro$oft
protocol for it's network neighborhood. TCP-IP is no problem, since
STinG, STiK, NOS and MiNT support it.
SO if you use TCP-IP you'll need to run an FTP server somewhere (PC or
Atari) and transfer the files with a FTP client.
Another option would be NFS, this when you use MiNTnet on your Atari.
Don't think someone tryed it yet, but it should be possible.

> I hope you dont live in my neighbourhood, your standards are about as low
> as whale-shit.

Eh?

> How would you define abandonded?, probably to suit your need for the item
> concerned. Anyway, being abandoned doesnt mean it is ownerless, it just

> means the owner doesnt want responsibilty for the problems its causing.

How many defintions of abandoned are there? Something the owner no longer wants, and has possibly discarded.

> That scenario doesnt apply to TOS, its not abandoned, its just not being
> developed, would you consider a house that dont get rebuilt every year
> abandonded!!

It is "sort of" abandoned. Atari no longer support the ST line in any way.

> >Please lay off this cars/jewelry analogy, it doesn't work with digital
> >media.
>
> Theft is theft you moron, of course it works.

I think he means that they don't care if it gets copied. They're never going to make any actual money from the product any more. This is all companies care about when it comes to theft, it's losing them money. Stealing something that's not making them money might still be stealing, but they're not going to be that bothered about it. And there's no current product directly descended from it either.

> >This guy has already got a legal TOS. He just doesn't like the language
> >it's in. Are you to deny him the pleasure of running an English TOS?
>
> No, i'l not attempt to deprive him of anything, he's welcome to buy an
> OS, like i had to, and many others with morals higher than yours.

Erm.. isn't it perfectly legal to do this anyway? Since he already owns the TOS in another machine (i.e. he has bought it), he could _legally_ run it on the other, as long as he never runs the same TOS on BOTH machines at once. This would be _illegal_ since he only owns one copy.

I think the bloke has every right to run his TOS on the other machine, even in the eyes of the law.

I'm sure Microvitec make a 14" and a 17" monitor that will both do
15KHz-35KHz. I have one of the 14" models (model no. 14VC2CCS2) I use with
my Amiga 1200 (in fact is was sold as a rebadged monitor by Amiga and Acorn
Computers for this reason). I don't know if they still make them, but a web
search might turn something up.

Hi.

I recently rescued an Atari SM124 monitor and I'm going to try to get it working with my STe.
However the monitor doesn't appear to have a lead connected to it or even a socket to plug a lead into.   :-0

All it has is a round hole marked video at the back. :(
I've never seen one before so I think the lead is either external or somebody has removed the connector for it on the monitor for some unknown reason.

Does anybody know if I can get a replacement for it?

I could be totally wrong about the monitor though since I don't know much about it.
It would be a shame to throw it out.

Thanks in advance.

Frank

The lead runs into the monitor and is connected inside...
(in what way it is connected, dont ask me, but I think it's soldered directly on the board)

>(in what way it is connected, dont ask me, but I think it's soldered
>directly on the board)

I was kind of hoping it wouldn't be something like that. :-(
I'm wary about opening up a monitor due to the risk of an electric shock. :-)
I've not had a lot of luck with monitors recently.
I managed to break a 19" Microvitec multiscan monitor that could handle any mode
the Falcon could throw at it. :(At least neither monitor cost me anything :-)

Thanks for the info. :-)

Frank

Yes you can use the power supply from the 520/1040 STFM, but you must
remove the power supply board from the STFM metal frame and use the
Megafile 30 power supply frame.

For a ST to work via the scart plug on a television does the TV have to be RGB or PAL compatible?

Does using a TV scart give the same quality of picture as a colour monitor?

Ive decided not to go for a multisync monitor as they sound expensive and just go for a good old fashioned tele (with scart).

Alex

Any powersuplly will do as long as it fits in the case and you have the correct voltages. All you need is +12v +5v and ground. Usually yellow is +12v red is +5v and black is gnd. Use a meter though...

Josh.

You need a SCART with RGB input on it to get a good picture.
If you have an STFM or STE (i.e. one with a TV modulator) then
you may have composite out, which will work on PAL composite. But of
course a different lead is required.

Its a long time since I had cover off an SM124 but I think the lead was on a
small header plug, the usual 0.1"
spaced thing. Don't know the pin out though.

Hi all,

I want to bulk transfer files from my Milan to my Falcon so that I can burn them onto my Falcon attached SCSI CD burner, and PARCP v3.80 seemed to be a solution. However the Doc. says that it's not Milan compatible as it 'lacks the ST-compatible parallel port' and it 'requires'one compatible parallel port(drivem by Yamaha YM-2149 and by MFp 68901)'. I'm only interested in the Milan to Falcon flow of data, but if the

Milan printer/parallel port also needs to be bidirectional, eg for
control signals, then, no go I suppose. Any ideas please.

Bob King.

Umm....SCART is sort of a standard, independant of RGB (which isn't a standard, it stands for Red, Green, Blue) or PAL. Scart can handle both RGB signals (IF you're using a UK/Euro ST then you need a PAL TV, if it's a US machine then you need an NTSC TV) and composite (which is like the old Sinclair and BBC stuff)....
It's not as good as a monitor as it will still be interlace scanned rather than progressively scanned but it isn't bad....I used to do this before I got a colour monitor, which is lots better....remember you can't do hi-res mono on a TV properly, which you can do on a multi-sync...

Hi Bob

Actually, it's the other way around. The Milan port IS bidirectional
while the Falcon isn't. The easiest solution would be to put the CD
in the Milan (oops, you didn't have a SCSI-card, did you), or else,
you could use a null-modem cable between the machine's. Or you could
build a real network :-)

Hi Jorgen,

I believe you of course, but Parcpdoc.htm definitely says:

"1.3.1 Supported computer platforms

PARCP has been designed to work on two different computer platforms:
     .Atari ST/STE/TT/Falcon ...... Milan is not supported yet because
it lacks the ST-compatible parallel port.

and at:
3.1 Requirements
Atari PARCP

TOS PARCP comes in two versions (PARCP.TTP and PARCP030.TTP)......PARCP030...will run on...a TT030, Falcon030.

Atari PARCP requires one ST compatible parallel port ...."

Something's a bit screwy somewhere!!!!

Bob King.

ST compatible parallel port is not bidirectional, neither the port on
the F030. Don't know what port is available on the Milan?
But if it doesn't work, I propose you use another solution.
More info on these pages :
http://gallery.uunet.be/saka/atari/lan/index.htm
You could try to use STinG and a nullmodem cable. If you have Magic on
one of the two computers then you can use BNet 2.07 and transfer the

files very easy.
If you don't have Magic on one, you will need to install a FTP server on
your Milan and get the files through a FTP-client on the F030.
About BNet setup, there is a little bit here...
http://gallery.uunet.be/saka/atari/reality/rtl8012.htm#BNet

Hope this helps.

Hello!

> Don't know what port is available on the Milan?

It's a PC compatible parallel port (Milan use intel SuperIO chip for
floppy, keyboard, ps2 mouse, serial & parallel ports).

> But if it doesn't work, I propose you use another solution.
> You could try to use STinG and a nullmodem cable.

Compared to the parallel port this is rather slow.

Tschuess

I have an IBM 340MB 2.5 inch drive in a Falcon030, that refuses to work with Hddriver. No probs with ICD or AHDI but HDDRIVER (7.6) keeps reporting bad sectors. ICD and AHDI both report none as does EDGE. Hddriver is unable to write to the boot sector properly? Got me buggered, any one got any idea's?

>like the old Sinclair and BBC stuff)....

One thing to watch is that some SCART leads do not have all the pins
connected - some are composite and sound only. But one made for an
Atari (with 13-pin DIN on the other end) should be OK.

>It's not as good as a monitor as it will still be interlace scanned
>rather than progressively scanned but it isn't bad....I used to do this
>before I got a colour monitor, which is lots better....remember you
>can't do hi-res mono on a TV properly, which you can do on a multi-
>sync...

Surely the monitor is also interlace scanned. I only get interlace
flicker when I connect my Falcon to the CM 8852 colour monitor working
at VGA resolutions without line doubling - the STFM and the Falcon in
low and med rez give no flicker.

Regards, /Peter/

Yes it is. The STs port is bidirectional, but it lacks some of the handshake
signals that a typical PC port has.

The Milan's port is fully PC compatible, with a full set of handshake
signals, fast EPP/ECP transfer modes etc. - but it can't be accessed in the
same way as the YM2149 port in a ST, so software that bypasses the OS needs
modifications.

This might be one of the drives that require special settings. Please
refer to the manual and the description of special settings for IDE
drives.

Hi Michael,

thanks for yours and others input, your remarks and others reinforce the
PARCP manual. All I can do is try and see. I have the required flat

ribbon cable. The pragmatic solution is a cartload of floppies.

Another solution is a SCSI card for my Milan, I know from Dennis and
others that they are available from Germany, customised to the mother
board, but does anyone know a source (not System Solutions) in the UK?

Bob King
